Nothing in particular in mind, but more the concept of sucking it out
rather than brushing it in.

Well they do make a product for cleaning your ears that uses suction
that can be bought a CVS. If it doesn't ruin the ear, maybe it won't
ruin a mic element. There is such a thing as low pressure for certain
applications.

Two thoughts come to mind:

1. Very carefully use a can of compressed air to blow the dust, etc., off the mic and the mic element opening without directly blowing at full force into the mic element opening.

2. There are very small "computer" vacuums made for cleaning keyboards and interior components that have a very gentle suction force.

Where is this TR relay at? I have looked at most of the rig, and also at the service manual for the 706MKII, which is available here. Is it on the filter board, or which board is it on?

I have noticed for the past few months that the receive seems to drop at times on certain bands-it started on 12m and now occurs on 15m as well. If you click the key or mic to quickly put it into transmit the receive comes back. To me this sounds like a dirty relay or one that is going bad, but it does seem to not be as bad after the rig has been on a while and probably heated up. It doesn't seem to affect 17m or below, or 10/6/2m either.

# 20470. Anyone parting out an Icom 706 original

Yahoo group: ic706 (2010 — 2015)
Date: 2013-04-04 02:09:37 UTC
From: John G.
Topic: 20470  Message: 20470

I have an Icom 706 original, and need a new filter board for it, as the one I have has some problems with the bandpass filter relays. Anyone parting out an Icom 706 that has this filter board for sale? If so, let me know the price shipped to Lawton, OK.

# 20472. Icom 706 reliability

Yahoo group: ic706 (2010 — 2015)
Date: 2013-04-06 18:49:55 UTC
From: John G.
Topic: 20472  Message: 20472

Recently I sent an email out looking for the filter board for an Icom 706 original because some of the bandpass filter relays on mine are going bad and I thought it might be easier to replace the entire board. I heard back from 1 or 2 other people saying they needed the same board.

That got me wondering, is this a common problem with the Icom 706 original? It is getting to be 16 years old or so. Are other common problems starting to show up in them that I should be aware of?

I've had to replace control components, but not the relays themselves. At least so far. But that was my own fault -- tuned across a band border testing an antenna for SWR dip. Bad idea.  I believe it was the 6m filter was stuck inline full time (shorted transistor or diode, can't recall now).  Even though the other bands would switch in normally, the impedance was screwy.

I have an original and a Mk2g.

Both have been used extensively mostly as mobiles.
The original has had 1 relay on the filter board fail, which affected one of the HF segments, new relays were a stock item at RS Components - might be Newark in some countries.

The Mk2g has had lots more failures, including the power relay, and the relays are different to the original radios and are not a stock item. I just soldered the power relay on because cleaning it didnt last.

If I needed another it would be a Mk2 or the original. Note that the Mk2 has bipolars in the finals, and Mk2g can have 3 different PA finals, the early ones not obtainable.

# 20476. Re: Icom 706 reliability

Yahoo group: ic706 (2010 — 2015)
Date: 2013-04-08 07:19:35 UTC
From: vk5zuc
Topic: 20472  Message: 20476

Interesting thread,
My 706 original has had very few problems despite extensive use early on. It is my main portable rig now if I'm not doing QRP. By chance this one has exceptional crystal stability. I did short the accessory power trace and loose a SMC choke on field day once but a local tech didn't charge too much. This screwed up the preamp.
The other fault was a dirty TR relay but that one has a lid that pops off unlike the band pass ones. A few wipes of the contacts with a small piece of ordinary A4 PC printer paper and it has been fine for years. After that I did have some spurious oscillations on HF. It was a devil to fix but in the end with cleaning all the screws holding the filter board a few star washers and puting the lid on tight it hasn't missed a beat for nearly half of its life.

My advice is typical curious-ham advice: Take the mc apart and see what you are dealing with, you may be surprised where the element is actually located.

Two thoughts come to mind:

1. Very carefully use a can of compressed air to blow the dust, etc., off the mic and the mic element opening without directly blowing at full force into the mic element opening.

2. There are very small "computer" vacuums made for cleaning keyboards and interior components that have a very gentle suction force.

# 20482. Frequency Accuracy - Band to Band

Yahoo group: ic706 (2010 — 2015)
Date: 2013-04-16 21:58:31 UTC
From: KAWill
Topic: 20482  Message: 20482

How should the frequency accuracy of the IC-706MKIIG vary from band to band?

I became interested in the ARRL Frequency Measuring Test and starting learning how to use Spectrum Analysis programs such as Spectran and Spectrum Lab.

Here are some results that I wrote down yesterday listening to WWV and CHU.

10.00 MHz - USB - Frequency display off 52 Hz
15.00 MHz - USB - Frequency display off 114 Hz
20.00 MHz - USB - Frequency display off 112 Hz

These numbers don't seem entirely consistent.

Changing to CHU the frequency display was off 85 Hz.

I was using Spectran running on my PC and it appears to be quite accurate. With the radio in AM mode, Spectran accurately measured the 500 Hz and 600 Hz tones that are broadcast by WWV and the accuracy was within 0.5 Hz.

The tests above were done in USB mode after setting the transceiver frequency 1 KHz from the WWV or CHU frequency, and then measuring the frequency of the audio signal which should be 1 KHz.

Thanks, Kent

AA6P

I ran a quick test with my mk2g.  I used a HP 8924c service monitor.  It will show WWV at 20 mhz to either 20 mhz or 19. all 9s to the last cycle.
I set the generator to the following frequencies and tuned the mk2g down 1 khz by the dial on the mk2g in the usb mode.  Read the audio frequency of the mk2g  with the 89324c audio input.  It will read to 2 decimal places.  I just rounded to the nearest cycle.
The mk2g showed to be 2 cps low at 3.8 mhz and 5 cps low at 28 mhz on the 8924c counter when transmitting in the rtty position.

| 3.8 mhz | 1000 hz audio tone |
|---|---|
| 7.3 | 1000 |
| 10.10 | 1002 |
| 14.2 | 1002 |
| 21.0 | 1003 |
| 24.9 | 1004 |
| 28.4 | 1005 |
| 52.4 | 1010 |
| 145.8 | 1038 |
| 443.9 | 1121 |

The 8924c was set to the above frequencies and the mk2g was tuned down 1000 hz on the dial.  The tone was then read off the audio counter in the 8924c and that is in the second colum above.

How should the frequency accuracy of the IC-706MKIIG vary from band to band?

I became interested in the ARRL Frequency Measuring Test and starting learning how to use Spectrum Analysis programs such as Spectran and Spectrum Lab.

Here are some results that I wrote down yesterday listening to WWV and CHU.

10.00 MHz - USB - Frequency display off 52 Hz
15.00 MHz - USB - Frequency display off 114 Hz
20.00 MHz - USB - Frequency display off 112 Hz

These numbers don't seem entirely consistent.

Changing to CHU the frequency display was off 85 Hz.

I was using Spectran running on my PC and it appears to be quite accurate.  With the radio in AM mode, Spectran accurately measured the 500 Hz and 600 Hz tones that are broadcast by WWV and the accuracy was within 0.5 Hz.

The tests above were done in USB mode after setting the transceiver frequency 1 KHz from the WWV or CHU frequency, and then measuring the frequency of the audio signal which should be 1 KHz.

Thanks, Kent

I have also participated in ARRL FMT with IC-706 MkII. I
find this radio useful for these tests, because I can
set the display directly to a resolution of 1 Hz. Many
good radios have a best resolution setting of 10 Hz.
I use GB3RAL beacon software as a spetrum display.

> Here are some results that I wrote down yesterday listening
> to WWV and CHU.

I have been aware of this issue for a long time. For ARRL
FMT I prefer to calibrate the system IC-706+soundcard
+software against at least two standard frequency signals.
For example for a 7 MHz FMT I can calibrate against RWM
on 4996 kHz and CHU on 7850 kHz.

Then I ran a small linear correction routine to calculate
the offset on the frequncy of interest. It is in the
form of a small Excel table.

There is also a clever utility developed by Joe Taylor,
K1JT, to perform exactly this task for WSPR weak signal
work. You may download the manual here:

Thanks Ralph, Mark, and Costas for your help.

Ralph's data looks consistent and what I would expect. I did not calibrate the spectrum analyzer program so will try that next. It appears that Spectrum Lab is calibrated via the options menu and I will see if Spectran has a similar capability.

Costas, I think you implied that you have seen similar inconsistency in your IC-706MkII. I wonder if the PLL function could possibly be a factor at different frequencies.

I believe the spectrum analyzer calibration compensates for inaccuracy and tolerance of the quartz oscillator in the PC. What about temperature or voltage changes that affect the frequency of that quartz oscillator? I'm wondering if any changes are significant enough to add to measurement error.

These tranceivers have a master oscillator, but the
factors entering in the frequency synthesis process
are different on each band. See the paper of K1JT.

> I believe the spectrum analyzer calibration compensates
> for inaccuracy and tolerance of the quartz oscillator in the PC.
> What about temperature or voltage changes that affect the frequency
> of that quartz oscillator? I'm wondering if any changes are
> significant enough to add to measurement error.

Indeed, there are quite a few sources of frequency bias
and each one with its own uncertainties.

Instead of fighting against each frequency bias and
uncertainty separately, which I cannot achieve without
properly calibrated test equipment, I prefer to calibrate
the entire receiving system at once against off-air
frequency standards. I'm aware that this way I introduce
the uncertainty of Doppler effect to the calibration.
Doppler effect was negligible in FTM of November 2012
but very noticeable in April 2013 on 14 MHz.

Regarding thermal and voltage stability, I leave the
receiving system on for at least 6 hours before the FMT.

My results in the last two FMT tests have been very
encouraging, especially if you consider my distance
from the transmitters, local noise and poor receiving
antennas.

Costas, Thanks once again for all the help. I repeated my tests and the results are now consistent. My IC-706MKIIG frequency readout is approximately 60 hz high at 10 Mhz and the same percentage error is seen at higher frequencies. I repeated my readings several times on different bands and was surprised to see the IC-706MKIIG drift 10 Hz during that time. It appeared to be slowly stabilizing. These radios get quite warm even in receive mode.

I switched to Spectrum Lab as it seems easier to use. My earlier readings at 15 Mhz were incorrect using Spectran. It was probably not displaying the correct frequency range at the time and I must have read some other frequency peak. When set up for the highest resolution it seems a little difficult to scroll the frequency display up and down.

Spectrum Lab was very close measuring the 500 Hz and 600 Hz tones on WWV and I did not even need to adjust the calibration. In regards to the quartz oscillator in the PC, I agree that it also needs to be warmed up. I don't know how much temperature drift might be expected, but even 0.01% would represent only 0.1 Hz for a 1 Khz audio frequency.

Do you have the TCXO? I know that helped with stability running meteor scatter with my 746Pro on 2M.

Easy check of test equipment calibration: Use FLDIGI analysis mode and count the 500/600Hz tones ON AM, not SSB. Once you see where you are, simply switch to SSB and count it again (making sure you are on frequency dot zero zero zero. FLDIGI is normally within .01Hz or less on the AM check on my computer. You use AM to eliminate any tuning of off frequency inaccuracy of the radio or the test equipment. Going to SSB then gives you the 500/600 tone including tuning error. On SSB, you will also see effects of Doppler, etc., so be sure you have a good strong stable signal from them.

FYI, the 7000 has TCXO and is much more stable, but still drifts as it warms up.

I've just received a used IC-706MKIIg that I'm setting up. There must be software for controlling the settings on the 706MKIIg what with a thousand memory locations to enter and maintain.

I've seen advertised the ICOM CT17 communications interface V Level Converter. I found the Instruction Manual on the internet but it
contains a bunch of BASIC programs. Is this the device I need for
computer control of the settings? If not, what software/hardware do I
need to maintain a spreadsheet on my PC and output to the IC706?

Thanks in advance. Bert KG6HIZ

RT Systems sells cables, but no programming software, for the 706 (or a good, working CI-V cable will work). For software, try:

http://www.arachnoid.com/JRX/index.html

OR

http://www.arachnoid.com/IcomProgrammer/index.html

I have used neither one, although I have both an "original" IC-706 and an IC-706MKII. Might give one or the other a try, however.

Look on ebay for some interface cables.  Icom wants over $ 100 for them and they are way less than that on ebay.  Here is one for about $ 20.

Item number:
121093559718

The Icom idiots left out lots of memory items that are sent down the cable.  I don't recall exectally what they are, but maybe the subaudio tones for the repeaters.  That means that no softwear will be able to save the whole setup or send certain commands to the 706.

Thanks to everybody for the advice. As Rob suggested, I unhooked the coax from the antenna and ran it to a dummy load, and everything worked fine, so I knew it was an antenna problem. I cut the plastic covering off the Hustler 20m resonator and found a bit of water inside. I flushed everything with alcohol, dried it out, and covered it with that rubber dipping stuff made for cushioning hand tools. It seems to be working fine now.

One thing that threw me off a little was running the SWR graph function from the 706. It showed a nice, low SWR, so I initially thought the antenna was OK. However, comma, we know the SWR graph runs at only a fraction of full power, so it wasn't recreating the problem I had when I tried to transmit at 100W. Evidently, the moisture was just enough to cause problems at full power, but not at low power.

Anyway, I'm back on 20 meters. If you hear me on the County Hunter net at 14.336 and then you don't hear me, you'll know the problem is back. Here's hoping... 73 - Lee

Well, it's "real" enough to be listed on some very extensive websites. Aside from that, I don't know, as I stated in my posting:

"I have used neither one, although I have both an 'original' IC-706 and an IC-706MKII. Might give one or the other a try, however."

I believe, however, there is a caveat listed in the descriptions of one or more of the programs about the inability of the 706 line to accept alpha-numeric "descriptions" for memory slots.

Thanks Larry. You have helped a lot of people on this web site for YEARS.

Hot tip for hams - Google 'Ham Nation' for a weekly ham TV show - very cool.

Well, it's "real" enough to be listed on some very extensive websites. Aside from that, I don't know, as I stated in my posting:

"I have used neither one, although I have both an 'original' IC-706 and an IC-706MKII. Might give one or the other a try, however."

I believe, however, there is a caveat listed in the descriptions of one or more of the programs about the inability of the 706 line to accept alpha-numeric "descriptions" for memory slots.

From: KAWill
Topic: 20482  Message: 20499

Gary - I installed FLDIGI and set it for Analysis Mode. The results are excellent as you mentioned and essentially the same as Spectrum Lab. Thanks for the suggestion and also to switch from AM mode to USB. I had run Spectrum Lab while receiving WWV in AM mode and that is great for checking the accuracy on the 500 Hz and 600 Hz tones.

Thanks to all once again for the help. Mark - I don't have the TXCO and I definitely notice the frequency drift for a long time after power-on.

Since we're talking about filters for the 706,
I understand they don't make an AM filter for the 706,
is there a filter I could use that would help when I try
to work AM and the slop buckets just overwhelm my receive?

Yes- the 2.8 kHz SSB filter does a very good job as a narrow AM filter. I believe it may have been discontinued though. If you can find one, I do believe the radio selects the wide SSB filter when you select AM narrow. The standard SSB filter is selected now, but I think it's a bit too narrow for the job...

I have a IC706 MKII and am interested in maybe installing filters in it; but what exactly do these filters do? Are they notch filters, or bandpass?? What would the advantage be if I am usually doing PSK31 or voice SSB? I've not completely been able to see the total value of a "roofing filter" ... why not just build them in as part of the unit to begin with? I do use RTTY and CW as well ....

They are band pass filters.  The ssb filter that comes with the mk2 is about 2,7 khz wide. You can look up the exect value.  That is about the same width as it takes for the human voice to be fully understood.  It can be understood if it is only about 1.8 khz wide, but will not sound very good.  The cw filter can be had at about 500 hz.  For cw this will let you seperate signals that are closer together.

Often the filters were left out due to the cost. Many rigs are now comming  with digital filtering and no options are needed for narrow filtering.  For hams that do not work cw, the wider ssb filter is good enough.  That cuts about $ 100 offf the price of the rig, and also gives the makers a lot more profit when they sell the filters seperate.

These radios were made well before the current "roofing filter " came to be so popular. They are not so different in a way. I also have a current rig with roofing filters.

The 706MK2 and G and I suppose the origional 706 come with a 2.4 filter.
I can't imagine someone not wanting the 1.9 ssb narrow filter to reduce nearby QRM but if you operate very very casual maybe not. I guess it all depends. If you do much on 20m it will probally be handy. Same if for the cw filter.

I think John in Lawton,OK is using the cw filter for RTTY.
I'm not up on the cw filters but there was a wide 2.8 and narrow 1.9 available for ssb.
It's all in the manual.

As for the AM recently discussed, I don't recall that ever coming up before and not sure but don't think any optional filters available for that.

I have used the MFJ dsp filter to further limit or notch the speaker audio with some success on ssb. CW guys have been using even basic audio filters with success for years to narrow the bandwidth to fight nearby QRM.

I used to have three 706's but have sold the MK2. One used to be my primary fixed station rig for about 6 years. I upgraded to a Elecraft K3 with
2.7 and 1.8 roofing filters for ssb.

Note that Roofing filters is a whole other can of worms and are not all able to perform the same so do your homework on that front.

Yes, I am using a 500HZ FL100 on RTTY, almost necessary in a RTTY contest. You just tell the rig that it is the FL223 instead and it lets you select it in SSB mode. You can get by with only the stock filters on SSB, but if you do much CW work at all you definitely need a narrower filter.

Regarding the AM issue, the SSB filter is selected if you select the "NAR" or "FIL" softkey while in AM mode (with no other filters installed).  I no longer have a 706, but I used to run mine heavily on 75, 40, and 10m AM. I re-arranged my filters a bit, but I seem to remember that if you install a SSB-wide filter (and tell the rig as such), it will select it instead of the the stock SSB filter.  BTW, the stock SSB filter is pretty close to 2.4 kHz wide, the SSB-wide is spec'ed at 2.8, but I swept it and found it closer to 3.1 or 3.2 kHz (all at -6 dB points).

# 20510. Power Spike

Yahoo group: ic706 (2010 — 2015)
Date: 2013-04-21 20:03:04 UTC
From: Adrian Rees (MW1LCR)
Topic: 20510  Message: 20510

Hi all

I have a 706MKII G and it seems to have killed two 144MHz FET Linears in pretty quick succession. A friend suggested that the problem may be the way the 706 deals with power output control. Apparently there is a 150 - 300 watt spike (only lasting Milli-seconds) on TX that is responsible.

Any one comment, ,,, is this correct and whats the suggested fix ?

Cheers

Adrian MW1LCR

# 20511. Original Icom 706 for Sale

The 706 puts out a full power spike every time it is keyed up.  The ALC then takes over and cuts the power back.  There is no known cure for that as far as I know..  Even if you cut the power back to 10 watts out, you still get a full power spike.

The only thing I know of is to run it at full power and put an attuenuater in line if you want less than full power.  Or get an amp that will handle the spike.

There is a spike on HF and probally on VHF too. I don't think it's possible to have that kind of spike on VHF with one final on VHF. I ran a TE Systems brick capable of 50w drive mobile for a couple years with no issues. In fact I've never heard of a problem on VHF with the spike.
To check for it, a scope or digital pep meter is needed.
The new Ic-7410 does this as well but it's a hf only rig.

I would think the spike would be at 50 watts for VHF since that is the output power before the ALC lowers it. You should be able to lower the power to the drive level for the amp by adjusting the 2m output pot inside the radio. Good luck!

On HF at least, the 706s, as do many ICOMs (but of my ICOM rigs, the 706 series is the worst), have a reputation for a "leading edge power spikes" ("LEPS"), which is not totally alleviated by reducing the output power setting. (Other brands of rigs also exhibit the LEPS

On HF frequencies, I have measured up to 160 watts on key-down on an accurate, true "peak-reading" watt meter (Ameritron AWM-30). An average-reading watt meter won't show the spike.

Phil Salas, an RF engineer of some "fame" (contributing editor to QST), wrote about this issue, and devised a "fix" of sorts.

Web site here: www.ad5x.com

Article here:

http://www.ad5x.com/images/Articles/HiPwr%20Pad%20RevA.pdf

On the other hand, don't know what brand of amp you were using, but I have used both my IC-706 (10 watts) and IC-706 (20 watts) into a Mirage 1080 and a Mirage 2516 2-meter amp, with no ill effects, and have not observed the same spike with the Daiwa 2-meter watt meter I have in line.

I'm not sure the HF LEPS applies to 2-meters in the 706 series.

The QST review of the 706 series radios (3 different ones, one for each model) covered this issue, and said that it was much improved in the MKIIG. They also more or less say that it is only a problem in "carrier based modes" like CW, FM and AM. It won't occur in SSB because the ALC overshoot will be gone before you start to actually speak.

I can't speak as to the 706MKIIG, as I have only the "original" 706 and the 706MKII, but the spike is there on HF for sure.

I have not observed it on VHF.

I note that on my IC-7200 the LEPS is not as bad.

I disagree about it not occurring in SSB mode, but, each to his own.

Basically on ssb, it takes the first few milliseconds of speech to adjust the alc.
Hf anyway.
Some newer rigs do this and some don't. It can be a issue with some solid state amps but mostly with lo drive ceramic tube amps.

I can only assume icom likes this method as its newest rig, the 7410 does it. Not sure about the 9100 and the 7100 is I think not out quite yet.

Roger, and that's when you get the "spike," before ALC pulls it back down.

It's not an issue with my AL-1200 amp, as it can take 130 watts of drive, and just soaks it (the spike) right up; my ALS-600 on the other hand, is not designed for that much exciter drive, so I've got one of those Phil Salas-designed gas discharge device attenuators on the input when I use the ALS-600 with the 706.

How so? ALC is developed from sampling the level while you talk. If you don't talk, ALC will not develop. The first audio spike will begin to develop ALC, or it isn't conventional ALC. If you mean a "bias" applied to control the power level set by the power control, that is something different and should be applied prior to output and not fluctuate with the speech or keying.

I've never checked the IIg I have to see if power is properly controlled or not, but have not noticed a problem with my 7000 yet. I have not tried either on an amplifier.

Thanks for the info. I was wondering if you know if the FL-232 350hz filter would work in the Original 706? I don't see an option for it in the menu, just the FL-100 (500hz) and the FL-101 (250hz).

Yes, it works. The radio doesn't know what filter it actually is -- it only knows because you tell it in the menu.  That's how folks use the 350 for PSK -- by telling the radio it's a narrow SSB filter. In the case of the Original 706, you could tell it either one was installed and it'll work.

# 20526. IC 706 Pwr out 100 watts, no audio

Yahoo group: ic706 (2010 — 2015)
Date: 2013-04-24 23:43:27 UTC
From: Frank
Topic: 20526  Message: 20526

When the RF knob is set for max output which is 100 plus watts, the audio is muted. When the RF knob is turned clockwise to received audio the RF output drops to approx 20 watts. A few people have offered help but nothing out side of what is stated in the manual. I need information from some one that is familier with the pots and trimers inside the radio for adjustment, or possible bad part. I have tryed all the settings in #7 set mode.

# 20527. Re: [ic706] IC 706 Pwr out 100 watts, no audio

From: LARRY J. FORD
Topic: 20526  Message: 20527

What "RF knob?"

Neither of my 706s has a knob marked "RF." There is a shared AF-RF/SGL knob, that affects the gain for RF RX, but not TX power output.

If in fact turning that knob truly affects the TX output, then something is terribly wrong with that rig.

If you press the "DISP" menu button, what does "Q1" setting show for "RF Power" When in that setting, the VFO knob adjusts RF output power.

From: Al Waschka
Topic: 20526  Message: 20528

The "RF knob" has nothing to do with transmit power.  It is a combination RF gain and squelch control for receive only.  How it works is explained in the manual and its blend of RF gain and squelch is variable depending on a setting in the menus.

What version of 706 is this?  plain 706, 706 MkII, 706 MkIIG?

When you say the power out is 100 watts with it all the way up, how are you measuring it? What mode?

Same question for when you measure 20 watts.

I'm guessing you are looking at the S-meter indication in receive which varies with squelch setting and is not indicating transmit power.

From: Frank Strickland
Topic: 20526  Message: 20530

Ok Larry thanks for the reply. Oh sorry about the RF/Sql knob term and
 by the way "706s" short for IC 706xxxx. Answer to the DISP, Q1 is set at H.
Information:  rF settings function RF gain control only, 59L setting functions as squelch control only. rF setting making my tests with the "RF/SQL" knob at 11:00 5watts with audio, 10:00 90watts no audio, 59L setting making my test with "RF/SQL" knob 10watts output with audio at
all settings of the clock.  Auto settings were 10watts and 80watts at 11:00 with audio and 10:00 no audio.
It looks like a under the cover fix.  ICom is on the hook. Thanks for the try.  Frank in Denver

Hello Al and group: You say the "RF knob" has nothing to do with transmit power.
How do you measure transmit (output) power? I place the 706MKIIG in CW mode, key the 706 and read the output on the watt meter. I use the settings in Set Mode #7 one at a time, (rF control function as RF gain control only), (59L control function as Squelch only) to get the wattage measurements.
I should be able to transmit max (output) power and receive audio with out having to change the RF/Sql knob to transmit  then receive which I cannot do.
No Iam not concerned at this time about S meter indication, Iam only concerned about getting max output power as well as the other part of communications receive the audio  of the person your communicating with.
Fixing the problem is not going to happen by trying to determine what is controling the output.  There is either output and audio or nothing ( why dosen`t it work)

Frank it sounds to me like your problem is more severe than an adjustment. Even though you have rf gain/squelch set as rf gain only it is still operating as squelch and also controlling rf power which it should never do. I have an original 706 so I don't know what you mean by 59L. Good luck but it sounds like your 706 needs a trip to a good repair shop. As you describe it you are correct, you shouldn't have to turn the knob between transmit and receive.

Thanks,
Al

Have you opened the lid and checked if you have B+ on the PA deck? There is a fuse on the PA brd. Also take a handheld and see if you can hear any tx on VHF. The VHF and the hf share the same predriver

Well I would go on line and find out what was the mod.
I would then make the decision to either reverse it or check it.
You may get lucky and find that a step had been missed like having to hold down a bunch of buttons and powering up while reciting the Boy Scout Moto

# 20543. Re: Ic-706 mk2G lost all rf output

Yahoo group: ic706 (2010 — 2015)
Date: 2013-04-26 22:35:06 UTC
From: DaveS
Topic: 20532  Message: 20543

Hello everyone,
I have found the problem, this is something I did not even think about. Took the covers off the radio, made a visible check of all the boards and connections. there were no signs of anything running hot or burned, made some voltage checks, keyed the ptt, transmit red led comes on but no output. I decided to plug the hand mike in the front of the radio instead of on the back and lo and behold, I had transmit on all bands. After more investigation of the back mike connector I found that when the fan is running, there is fair amount of dust/lint on the vent areas on the rear of the radio ( including the mike connector ) I removed all the dust from the vent areas on the rear of the unit, including any that I found inside the radio, The radio is as clean on the inside as it is on the outside, the radio is working fine. Would never have thought dust would bring a fine radio to it's knees, Incidentally, I have done the fan mod so it runs all the time at a lower speed until the sensor kicks it into high gear, I am putting this on my list of things to do at least once a year. Thank you all that responded to my request for help, Great forum, great members, 73 everyone, and Thanks again.
Dave

Yes, dust will bring me to my knees as well. When my wife sees dust on the furniture I'm on my knees with a duster. :)

Good Day!!!

Did the Radio Work on 2M before the Mod?

Most MODS require you to do a complete Reset which will wipe all Memory and Settings, which is not a big deal to have the Extended Frequencies!!!

73 & 72

# 20547. Remote Control Cable pinout

Yahoo group: ic706 (2010 — 2015)
Date: 2013-04-27 00:15:37 UTC
From: Charles Levasseur
Topic: 20547  Message: 20547

Does anyone know where I can find the pinout for the remote cable. I would like to build my own using a 3.5 mono male connector and a db9 serial connector but I cannot find the pinout anywhere. My goals is to be able to control the radio with HRD (ham radio deluxe) and N1MM software from my computer.

Thanks

# 20548. Still looking for Icom 706/706MKII

You'll need TTL level converters to connect CI-V to RS232. It's probabliy cheaper to buy a CI-V to USB cable from eBay than to source all the components! !

I have one if you are still interested. I have not used it in years. I may need the power cord.
It is separated and the head is mounted on a bracket. This was one of the ones with 2 meter only.
I should get $250 plus shipping if your interested.

I followed the instructions on this website http://www.gdickinson.co.uk/

I used the TTL-232R-5V cable I ordered from http://www.futureelectronics.com.  It was 20 bucks for the cable about 7 bucks shipping, about a dollar for the mono connector and I now have a CI-V interface that is not plagued with all the driver issues of the cheap USB CI-V cables on eBay which use the Chinese knockoffs of the Prolific chip set. It took me about 5 minutes to make the cable once everything arrived.  All in all 30 bucks for a good CI-V interface is a really good deal compared to 140 bucks from Icom.

$30 buck??

I paid a total of $27.00, including shipping, for a CI-V/USB interface with an FTDI chipset (no Prolific issues there!) from a vendor on Amazon. Works great with HRD/DM-780, M-110A, and every other digital program I've tried with for rig control of the IC-706.

You just have to know what you're buying.

# 20560. FS: Icom FL100 CW filter

Yahoo group: ic706 (2010 — 2015)
Date: 2013-04-28 20:21:57 UTC
From: John G.
Topic: 14516  Message: 20560

I have for sale an Icom FL100 500hz CW filter that fits in the following radios: 706, 725, 726, 728, 729, 736, 737, 738, 746, 756. It will not work in the 707, 703, or 718 as those take the FL52 or FL53 instead. I am asking $75 shipped for it and can take paypal/check/MO/Cash. International shipping can be worked out for a little more for shipping costs.

HI John,
I have a 706 ser.# 07440 and it has an FL30 ssb filter in it and I understand its supposed to take a FL223 or 103 ssb filterbut has the same center frequency. I just bought it in a non working condition, mostly out of curosity, I have never owned one and wanted to check it out. I really like the way its made, it wont go into the xmit or recieve mode,I think the front end may be ok tho, I put a signal into it at the output of the missing cw filter and got an S9 reading on its S meter. the keyer is working and all the other functions seem like they are ok too it may have a bad TR relay, I checked the voltage on the finals and both them and the driver seem like good with no shorts. I checked some of the plugs on the PA board for T voltage but had to quit at that point due to lack of time. I will pull the service manual out and go from there, luckily, it did have a new svc manual with it.
I think I will buy your FL 100 if you still have it, whats your paypal address info and I will get it to you soon as you let me know. I don't think the VOX is working, can't get any adjustments out of it to see if its keying or what its doing either.
OK John, let me know and I will send you a payment.
my address is good at QTH.com or John Gabbard

Dave - I just had my 746 repaired by a really good service shop in Anderson SC. He was an ICOM authorized service center for years before having to move to CA and then back to SC. So he is back in business again. If you need contact info, just let me know if it gets to that.

Topic: 984  Message: 20566

: Who is this unsubscribe message directed to? I've not sent any such
: request.

I'd have to dig through the archives to find the original poster now, but, someone sent a message to the group with only the text "unsubscribe".

To unsuscribe from a Yahoo group, one only need send a blank message to the name of the group followed by -unsubscribe as shown on the group home page and also at the bottom of each message posted through a group, not the word unsubscribe to the group posting address. Some older systems allowed just the word unsubscribe in the message body, I'm guessing the original poster was confused. In many cases I have seen many, many "unsubscribe" posts sent to a group without the intended result. This is generally followed by up to a few dozen posts to the effect of "why can't I unsubscribe????".

For this group, the unsubscribe command is a blank message to the following address, originating from the subscribed address:

ic706-unsubscribe@yahoogroups.com

# 20568. R8,T8,L8 voltages missing on main board

Yahoo group: ic706 (2010 — 2015)
Date: 2013-04-30 02:38:25 UTC
From: John
Topic: 20568  Message: 20568

Hi guys, maybe some one can steer me in the right direction, I recently purchased an original 706 ser# 007440 mainly out of curosity and having never had one before. It will not receive or transmit but has very light audio I am able to hear. I checked for the R&T voltages on the main board,they are missing, they come from the PA board and I can't locate a VR on that board that supplies 8V. to the main board, usually there are 2 transistors that turn off the rcv voltage and turn on the transmit voltage. I do have a service manual but I need a parts identification so I can find the components related to these modes. Thanks, John KF7OM

# 20569. Icom 706 Stuck in Transmit

Yahoo group: ic706 (2010 — 2015)
Date: 2013-05-04 01:53:57 UTC
From: kc9swv
Topic: 20569  Message: 20569

Greetings All,

I've recently acquired a broken IC-706 (first version) that I'd like to fix but it's exhibiting some funny behaviour. As soon as I turn the radio on, it begins to transmit. If you turn the dial out of the amateur bands, it will go back into receive. I've checked the Microphone PTT circuit, and all the PTTs in the accessory connectors, etc. None of them are shorted to ground.

When you tune back down into a legal band, you can hear the TX/RX relay click and the TX light comes back on. I have checked with my VHF HT and my dummy load resonates enough that I can hear myself calling CQ from the 706 to the HT, so it really is transmitting.

I also tuned to a public service frequency outside of the amateur bands (154.370) and I was able to receive just fine on VHF. I don't have an HF antenna up yet (this is my first HF rig), so I can't find anything to tune on HF to check that receiver section. I don't know what I'd find near but not in an HF band anyway...

I tried resetting the CPU to no avail...

Then, I found that the PTT terminal on the control head microphone connector is 0.6V when it should be 4.1 (during receive). Sounds like it's shorted to ground in the unit before it gets to the connector which is trying to put the radio in transmit.

Testing with a DMM I get 125 ohms resistance between the PTT pin and GND in the mic connector on the control head. On the radio body when I test this connection it tests as an open circuit (which is what I would expect since you ground the PTT pin to transmit). Looking at the schematic in the service manual, I began to suspect that Transistor Q4 in the PTT circuit in the head is bad.

It's still in the circuit so I know other components in the circuit can throw off the measurement, but when I test it I get the following measurements:

Base to Emitter: 0 Ohms
Emitter to Base: 2 Ohms
Collector to Emitter: 127 Ohms
Emitter to Collector: 125 Ohms

These don't seem right to me at all; I was always under the impression that a transistor would test like two diodes. Maybe someone who knows more than me can help point me in the right direction before I go to radio shack tomorrow to get some solder wick (I don't have any at home).

Thanks,
KC9SWV
Morgen Benner

Mine did this. That cheap cable that runs to the rear mike connector,
which is made of crummy plastic and very easily pinched by the top, was
shorted
where the top crimped it against a chassis bulkhead.

# 20575. IC-706 MKIIG startup failure

Yahoo group: ic706 (2010 — 2015)
Date: 2013-05-05 18:46:23 UTC
From: f4avi
Topic: 20575  Message: 20575

Hi,
I recently bought a defective IC-706 MKIIG.
The seller told me about the failure :
- it began with a "clicking" relay noise, as soon as the 13V8 was applied.
- the rig can't start and one day, the "click" stops and nothing else happened.

I found the article from N1EQ about the HV line problem (http://www.n1eq.com/tech/page_03.html) and effectively, the copper was cut as described. I repaired it, but the rig didn't start ( there was about 12V on the HV line however). In fact, the transistor Q591 on the PA board (whose should drive the relay) was dead. I replaced it by a BC847 transistor with 10k resistor in its base and the rig starts up !

Some hours later, I connect the rig to my 13V8 PS and I hear the "clicking" relay and the rig don't start again !

I read N1EQ description again and saw that R591 was mentionned as defective sometines. I measured the resistor and found 26 Ohms ! It sould be 4R7 !
That why the relay "clicked" : the HV voltage is to low and the voltage regulator for the CPU supply is unstable and the relay is erratically driven !

hope this experience will help someone else ...

73's de F4AVI Fabrice

It did it with the MIC removed as well. It turns out it was transistor Q4 in the control head. I desoldered it, verified it was shorted, tested the radio with it removed. Everything I've tried so far has worked with it removed. I have a replacement on order from Digikey:

http://www.digikey.com/product-detail/en/BCX5410TA/BCX5410TACT-ND/2712088

When it arrives, I'll replace it and post back here if it works as expected. The original ICOM part is discontinued, but this should be a compatible enough replacement for $.49.

I have an original 706,the display comes on and the menus seem to be functional. I checked voltages on the final board and found no T and no R voltages, On the filter board in the cw mode 8V. drops when the key is depressed, and same in the ssb mode. I have a schematic out of the service manual,its new, but I can't find the transistors that switch the R/T voltages or could this condition be caused by RL1 on the final board?
Thanks, John KF7OM

# 20578. 706 MkII DSP

Topic: 3589  Message: 20579

The DSP module was an "add-on" option for the 706MKII, no standard equipment, and thus was not covered in the standard manual. As I recall, there was an "Instruction Sheet" (or two) that came with the module when purchased.

I may have a copy on my hard drive somewhere, or you might look in the files section of the Yahoo Group web page.

The DSP module was an "add-on" option for the 706MKII, no standard equipment, and thus was not covered in the standard manual. As I recall, there was an "Instruction Sheet" (or two) that came with the module when purchased.

I may have a copy on my hard drive somewhere, or you might look in the files section of the Yahoo Group web page.

Dsp has settings of 1-9 with 4-9 about useless. It also provides I believe a auto notch filter.

# 20583. No audio on transmit.

Yahoo group: ic706 (2010 — 2015)
Date: 2013-05-12 15:30:58 UTC
From: kglong
Topic: 20583  Message: 20583

I have been looking and have not found anyone talking about this.

I have an IC-706mkIIG. Three years or so ago, it worked fine in my car. Now I am trying to set it up at home. I have antenna, feed line and power supply. These seem to be OK.

On FM, VHF and UHF, I receive fine. The problem is with transmission.

A carrier is transmitted but no audio. All you hear is static, above the background noise level.

I am using the remote control head with the separation cable.

I moved the mike to the back of the radio, but got the same results.

BTW, I don't have an hf antenna right now, so I cannot test the HF side.

Any suggestions?

Thanks,

Karl G. Long

Hi Karl- I remember reading on this website, a capacitor or another part can be damaged where you plug in separation cable to either the control head or the main part of the radio. But i do not remeber what happens  to the radio. Plug the radio back to geteher just in case there is a bad connection in the cable. 73-Steve--WB2OEE

Hi Robert,
Did you ever find the cause of the high output?
I have a 706 here that is doing the same thing you describe. The power goes to full output on any setting over #4

Thanks,
Gordon
N6WK

>
> I have an IC706mk2g that puts out 150 watts on all HF bands. The power was measured with a bird wattmeter into a 50 ohm load. Also the internal power meter only reads 50 watts and the SWR indicator does not work. The internal HF power control has no effect. The power can be reduced by the front panel control but to get it to 100 watts I need to reduce the dial to 2 which originally was about 20 watts. I tried the Set Mode procedure in the service manual which had no effect. Has anyone experienced this problem? Thank You.

# 20589. FM heat

Yahoo group: ic706 (2010 — 2015)
Date: 2013-05-17 10:36:39 UTC
From: rotwang1955
Topic: 20589  Message: 20589

When running FM mode on my IC706MKII on either 6 or 10 meters the fuse in my power cord blows. Nothing spectacular (or particularly fast- usually gives me about 5-10 minutes) When I pull the old fuse out it's as hot as a 2 dollar pistol. Only on 6 and10 at full power FM. What should I be looking at?

Thanks

Topic: 20589  Message: 20590

Make sure the output of the 706 is 100 watts.  Some reports of them are having problems of the power going to about 150 watts. Probably not your case.

Make sure the amp rating of the fuse is correct.  Chances are the fuse holder is not making good contact with the fuse. It may need changing or working on.  From what you describe, I would almost say the fuse is not making good contact with the holder and the heat is melting the fuse element from the end of the fuse.  Does the fuse look blown really bad or is it just sort of sagging in the middle ?  If so, suspect the holder.

Look at how much current the radio is actually drawing. That will show whether it's a rig, fuse, or fuse holder problem

"What should I be looking at?"

Actual current draw, fuse rating and I've had many problems in the past with loose fuse holders and loose fuse end caps.

First, look at the duty cycle. How long are you keeping it keyed and how long is it unkeyed. It sounds like you are running full power on those bands. Being on FM means the radio is running full power the entire time you have it is keyed. It needs that cooldown time unkeyed to recover from a long winded key down situation. The fuses and all connectors need to be looked at during those periods right after you let up the PTT. Feel them with your hand. If they are warmer than ambient, they are producing heat and also losing a little voltage drop across them. The longer it goes on, the worse it will get. When it gets really bad, you'll melt the solder in the end of the fuse ends, where the fuse element are welded. The crimps on the wire in the power connector and the fuse holders also need to be looked at suspiciously. Heat is a no-no. Even the device that the fuse slides in to needs to be looked at, as well as the spring that holds tension on the fuse itself. I've had many of the springs lose temper due to heat and have to be thrown away. It should press hard on the fuse, if the holder is that type of holder.

Look for heat. Check for current draw, etc.

If possible measure current draw. If you have much voltage drop, your probally going to have added current.

Those stock fuse holders give problems at times SO it would be a wonderfull idea to change them to oversize fuses for more contact area
available in blade or cartridge style.
You can get them at Wal Mart or car stereo suppliers.

Make sure your power leads are not excessively long. Shorter is better with no breaks/extra connectors/splices.

You can also try 90 watts or if no wattmeter power level about 8.

The Molex plug on the back of the rig may be getting hot also. You don't want any potential damage there so either a increase in duty cycle or reduction in power may be in order.

They can be set so they can be used as a CW keyer.  Look in the manual to see where that is in the setup.
Not sure off the top of my head if they can beset for anythingelse or not.

Hello All,
My 706 mk 2 g is deaf on 40 meters and also has no output on 40. tried a full reset but no help with this problem. can anyone give me some advice on what would cause this problem? All other band are working fine in receive and transmit. I sure could use some help here. I am at a total loss here. I even checked the antenna on another radio on 40 meters and it works fine, so it is not the antenna. Please help me with this problem, 73.

sounds like one of your filter relays is not functioning. I had to replace a few of mine. Be carefull when attempting to TX as it is at full power with no where to go.
I have the orig 706 so do not have svc man for the 2G but you should be able to find it. it will likely be either the radio or antenna side relay. either will cause the issue.

My 706 mk 2 g is deaf on 40 meters and also has no output on 40. tried a full reset but no help with this problem. can anyone give me some advice on what would cause this problem? All other band are working fine in receive and transmit. I sure could use some help here. I am at a total loss here. I even checked the antenna on another radio on 40 meters and it works fine, so it is not the antenna. Please help me with this problem, 73.

Dave

Anyone have any input on using a 1st generation 706 and and LDG IT-100 auto tuner? Seems that it does not respond to the TUNE button on the 706, but the tuner works fine with its own tune button. How should the tuner setup in the 706 be set?

Thanks all!

73,
Larry, N2HBX

I run my IC-706 (original) with the LDG IT-100 in my Montana, it was plug and play. I have two Hustler masts (switch-able) on my van with multiple resonators for each. Both the radio tune button and the LDG button work fine. Check your interface cable. Pat, W2DHB

Assuming that:

1. The LDG IT-100 is truly "plug-compatible" with the 4-pin Molex tuner port connector on the back of the IC-706;

2. The interface cable between the LDG IT-100 and the IC-706 is wired correctly and not damaged; and,

3. You're not trying to tune the IC-706 on 6 meters with the "TUNE" control button on the front of the rig;

Then

Check ITEM 13 in the SET Menu (page 44) of the IC-706 Manual: If "OFF" (Tuning starts only when the TUNE button is pushed), trying setting it to "ON" (PTT Tune) and see if the tuner starts a tuning cycle when the PTT is pushed on a new frequency. If "ON," set it to "OFF."

You might need to reset the CPU if 1,2 & 3 are not the issue, and resetting ITEM 13 doesn't work.

Looks like the problem was, in fact, trying to use the TUNE button on 6 meters. Did not realize that the TUNE button was disabled on 6. Installed my 20 meter hamstick and hit the button...SUCCESS!!! Thanks for the assistance!

Date: 2013-05-28 14:22:50 UTC
From: LARRY J. FORD
Topic: 20603  Message: 20608

The archives have postings on the fact that the IC-706 CPU did not have the internal circuits and/or "firmware" to enable tuning the AH-3/4 on 6 meters.

That is noted in the documentation for the AH-4 (and probably in the IC-706 manual as well).

Tuning on 6 meters in the IC-706 series was introduced with the IC-706MKII.

From: islandsurfer58
Topic: 20609  Message: 20609

Radio mkiig and watt meter shows full 100 watts out on ssb but no audio. First started with a loud hum when I turned on the radio. Unplugging the mike the hum stopped or if I plugged in a head set it went away. Made a few contacts but now it's only the carrier going out. Did all the manual adjustment, both mike jacks and tried the Heil mike. Nothing. Antenna swr no change in it. Radio is well grounded. Don't use the other modes but will check them next. When mike keyed in ssb the meter shows full power out without talking into it. Thanks, Ron. HP3RJC

# 20610. Modulation ☐ Demodulation Software Radio releases MDSR V2.6

Yahoo group: ic706 (2010 — 2015)
Date: 2013-05-31 01:07:55 UTC
From: alexschwarz237
Topic: 20610  Message: 20610

Hi Everybody;

The next version of the MDSR software V2.6 is now available. This software is free for amateur radio operators and it requires a 12kHz IF output from a receiver's IF or a 455kHz IF to 12kHz down-converter. The IF is digitized through the soundcard and processed, demodulated to increase the AF audio quality of standard transceivers.

The MDSR is a multi platform software that can adapt to any transceiver with a CAT interface and enhances the user interface and modes available. Currently the MDSR can demodulate a SSB,AM, DRM and a wide range of digital modes like, PSK, RTTY, QPSK, Morse code decoding and many more.

In the latest version V2.6 the MDSR software extends the local transceiver via the internet to a remote location.

Please go to:

http://users.skynet.be/myspace/mdsr

For more info and how you can upgrade your analog transceiver to an SDR.

All the bests and happy DX;

The MDSR Team

SSB doesn't have a carrier?? How are you measuring the 100W output and how are you monitoring the audio? I would guess at a mic problem if it works ok with other mics ??

# 20621. MK2G Main Board 5V H5V problem - radio won't power up

Yahoo group: ic706 (2010 — 2015)
Date: 2013-06-09 13:12:09 UTC
From: vk2kn
Topic: 20621  Message: 20621

Thanks for taking the time to read my post.

The 5V regulator (IC271 TA78L05F) on my PLL board blew which I replaced, but I have found that while I have J1381 between the the PLL and MAIN boards disconnected, I have 5V on J254 pin 1 (H5V) and 13.8V on pin 32 (HV), but when the PLL BOARD is connected to the MAIN BOARD, the voltage on HV line drops to 2V and now no voltage shows on the output of the regulator supplying H5V.

I lifted D217 on the PLL board (between HV and 5V regulator input) and found that HV wasn't pulled down when the MAIN board connected, so the issue seems to be with the 5V rail.

Next, I lifted L2001 (10uH) on H5V rail on the MAIN board and found that H5V tested 5V to the inductor pad and the 13.8V HV line was OK.

Measuring the DC resistance between the CPU side of L2001 and MAIN BOARD ground shows 3.4Ω. I suspect that there might be a faulty SMD Cap or the CPU has died. I've checked D2141 and I can't see any other components that may be causing this unless the E2PROM IC2121 is cactus, but I wouldn't have thought so.

Is there anyone else out there that's had a similar problem and willing to shed some light on this and can anyone measure the DC resistance between L2001 on the top side of the MAIN BOARD and ground and advise if they're also seeing 3.4Ω or some other value?

Many thanks,
Peter - VK2KN/VK4LC

Subject: [ic706] Band scope, panadapter, frequency scope: How to outboard one with software?

Does anyone know of a hardware/software method of using a computer and software to interface with the 706 to create an outboard band scope/panadapter type display to see signals up and down the band being worked, such as the Pro II/III and 7600 have in their displays?

To my knowledge, there is not a limit published in the manuals for the IC-706 and IC-706MKII that I have.

However, at some point, it would seem that signal losses from a long run of cable might begin to affect communication between the control head and radio body.

I guess one would have to find out what gauge wire is used in the factory cable to begin to calculate those losses.

You might call the Tech Support folks at ICOM America in WA and ask them; those guys are pretty good at answering such technical questions. I've pestered them several times.

I have extended mine to about 10m (30ft) using good quality CAT5 cable however I do sometimes get RF breaking through into the Mic on certain bands on full power, in hindsight I should have used screened cable but didn’t have any to hand.

Yep, I meant to add to my posting that at certain lengths, and on certain bands, you may turn the control cable into a nice receiving antenna for RF!

Shielded cable, plus judicious use of ferrite chokes and/or toroid cores would likely be advisable.

Take a tap off the first IF @ 69.0115MHz (SSB/AM/FM) and feed it into a $20 RTL2838 DVB-T USB dongle running SDR# on windows or GRC/GNU-RADIO/FFTW on LINUX.

If you use the 2nd IF (9.0115MHz), you'll need to mix the output to get it in the tuning range of the dongle which is typically 50MHz to 2GHz.

A raspberry pi will run FFTW and composite video o/p could be fed into a small screen as used with reversing cameras and composite input found on some 7in DIN mount car systems for field day/mobile use too.

Thanks for your reply. I figured the info would have to come from the if. I couldn't see how info from a sound card hookup like in HRD w DM780 could display ssb signals on a waterfall, for example. Thanks again. I will look into this.

HRD will display signals on a waterfall, but only across the bandwidth of the audio card, usually about 96KHz, limited a bit by the audio bandwidth of the receiver.

Matt at http://www.sarts1.com/ repaired my 706 about 2 years ago that had the same type problem.  Cost was just under $ 100 including his shipping back to me.

Lots of the 706 rigs seem to hae the same problem.

I highly recommend Matt Adrian's shop, SAR Technical Services, Inc., an ICOM-authorized, but independently-owned shop in Michigan.

I have sent two 706s, an IC-7200, and an AH-4 tuner to him for various repairs and mods over the past few years.

All work has been performed quite well, quite reasonably, and in a timely manner. In fact, he refused to charge me for trouble-shooting the AH-4 when it turned-out to be just a bad coax cable that I had missed in my own trouble-shooting efforts.

Check out his ratings on eHam.

SAR Technical Services, Inc.
1792 Nash Dr.
St. Joseph, MI 49085
269-429-2334

http://www.sarts1.com

No financial interest, just a satisfied customer.

Very true and there is a bandscope function that will tune the radio across the frequencies you set with a nice display. Granted its not as fast as a spectrum analyser or some other solutions but it worked for me with my old yaesu a year or so ago. The sweep speed was limited by yaesu's CAT port, in Icoms case, CIV. This was selected from a drop down menu from the main tuning screen, not from within DM780. With that implementation HRD would have been reading back the received signal level from the CAT port and my asumption here (which is never a good thing) is that the Icom will support bidirectional communications and report this back to HRD so this feature should be enabled.
 I am interested in setting this up as I recently picked up an origional 706 that has a few issues and when Ive made the repairs and put together a CIV interface I will look into this a little more.

Hi Ed,

I've got a SM220 on my TS-820 with the BS8 pan adaptor which uses the 8MHz IF and this is what prompted me to look at implementing a band scope on my other radios. The end result is to have the tuning of the band scope interfaced into the CI-V so the radio will adjust frequency to my input on the scope.

SDR# (SDR Sharp http://sdrsharp.com/) is easiest to get going for proof of concept testing on Windowz and to use in the shack, but a Raspberry Pi with FFTW is my aim for a mobile/portable bandscope.

More info on using the cheap USB DVB-T dongles here http://www.rtlsdr.org/ and http://sdr.osmocom.org/trac/wiki/rtl-sdr

Enjoy.

Dave,

That's a common fault and one cause can be checked by lifting one side of the fuse on the PA board and check the current with a MM between the fuse and post with the rig connected to a power supply.

14V (HV)< ------|[--Fuse--]<---DMM--->|---->PLL Board
Fuse mA Fuse
clip clip

If you're not seeing anything (not even a few mA, chances are the track under the 5v regulator on the PLL board is shot as the adhesive on the rubber spacer eats away the track over time.

If that's the case, remove the PLL board, take off the spacer in the corner under the 5v regulator being careful not to remove the diode next to it, clean around the area and solder a jumper around the HV track where it's broken, put a spacer in of same thickness, but attach to the chassis and not the PCB board as Icom did, reinstall the board and check the current again. If you're now seeing a few mA through the fuse holder now the problem is fixed and you've saved yourself a few $$$ too.

All up, it takes <30 mins to do the repair.

Enjoy,
Pete - VK2KN/VK4LV

Matt Adrian in St. Joseph, MI is absolutely the best ICOM repair facility..I've used him several times for repairs to my several pieces of ICOM gear..he's honest and capable and thorough..but he's a one-man-show there at his place so there may be a little delay in getting telephone responses etc..and for those grownups among us out there, he's a former Heathkit employee J..T

# 20648. Re: MK2G Main Board 5V H5V problem - radio won't power up

Yahoo group: ic706 (2010 — 2015)
Date: 2013-06-23 15:17:24 UTC
From: vk2kn
Topic: 20621  Message: 20648

Ok, here's what I've found so far:

1. I replaced the H5V regulator (PLL BOARD IC271) and faulty R591 4.7Ω on PA board and then found L2001 10uH inductor was open circuit on the MAIN board on the H5V rail.

2. I measured DC resistance on H5VL side of L2001 and GND at 3.2Ω which was causing excessive current draw on 5V regulator and probably caused R591 to go faulty and now read 34Ω. I tested all resistors, diodes and capacitors directly connected to the H5V/H5VL rail and they all tested OK.

3. I lifted VCC legs (8 & 47) on IC2001 HD6433337YA56F on the MAIN board and resistance now reading 32KΩ on H5V/H5VL rail, so excessive current draw causing 5V regulator and series inductor to blow is most likely from faulty IC2001 CPU.

Have emailed ICOM for a price on IC2001, but I expect it's not going to be a stocked part and they'll probably say I'll need to replace the MAIN board :-(

Also, cleaned up the area around the underside of the H5V regulator on the PLL board as the 14V track was starting to look very sad.

It's disappointing to see so many people having problems with R591 on the PA board and also the adhesive on the spacer on the PLL board around the underside of the H5V regulator. I believe this is something that ICOM should have addressed as this IC706MK2g is a late model unit and we should not be seeing so many units suffering these faults.

I'll update when I get a new CPU into the unit.

Thanks for reading,
Peter

# 20651. CT17 connections and software

Yahoo group: ic706 (2010 — 2015)
Date: 2013-06-30 05:08:36 UTC
From: bass2444
Topic: 20651  Message: 20651

I just bought a CT17 CI-V level converter to link my IC706MKIIG to a notebook with USB ports only running Windows XP. Can I get some suggestions about:

1. What's a good cable for RS232C/DB25 to USB? Will any one do?

2. What software to run on my PC for using a spreadsheet to load parameters into the IC706

Thanks in advance.

Bert KG6HIZ

It works but not completely the same.

One problem is the original used a pot for RIT not the rotary encoder, so that knob will not change the memory in use, just RIT in steps.

Its more of a problem using an original head to control a Mk2g, because the RIT sweeps through about 300 memories from stop to stop.

Topic: 20654  Message: 20654

I am looking for an Icom 706 or 706MKII to replace the one I sold a couple of months ago. I thought the 706 was having relay problems, turns out it was the antenna instead, and I miss is. I have a couple of radios that could be worked into a trade (Yaesu FT857, Yaesu FT450) or could buy it outright. Let me know if you have one you are willing to part with. A CW filter with it would be nice also but not necessary.

My 706 MK II is practically sold on eBay so I need to dispose of the accessories I have left. If not sold soon, they are off to eBay. For sale:

OPC-581 extension cable: $35
MB-63 Icom bracket and swivel mobile mounting base/arm (not genuiine ICOM MB65): $55
Mobile mounting bracket for 706: $25 (Fits 706 but NOT genuine ICOM MB62)
PS-125 P/S: $125.
SP-20 Speaker/audio filter : $90
SP-21 Speaker : $145

I've now replaced the MCU and VCC to GND on this reads 30KÎ©, so I'm about to reassemble, check MCU VCC 5V PSU and all being well, the 706MK2g should be ready to fire up once again.
Removing the faulty MCU from the main board:
706 with MCU removed:
New CPU in place:
Replacing the CPU cost under AU$50, which is a lot cheaper option then replacing the main board and you also get to have fun with multi-pin SMD reworking as well as rectifying some 706 design issues along the way on the PLL board. --- In ic706@yahoogroups.com, "vk2kn" wrote: > > Ok, here's what I've found so far: > > 1. # 20663. Icom 706MKII VOX loop problem

Yahoo group: ic706 (2010 — 2015)
Date: 2013-07-29 01:57:41 UTC
From: af5cc
Topic: 20663  Message: 20663

Here is a message that was posted back in 2012:

"Trying to get VOX to work on a IC706MKII ... i haven't used VOX on it before, and the previously owner didn't either.

VOX will go to TX just fine (and the vox-delay & vox-gain seem to behavior appropriately) ... but the instant it drops to RX, TX gets re-triggered, and it loops (and can hear the relay chattering).

I have hit up the manual, and know there's variables of:
Mic Gain
VOX on/off (M menu)
VOX Delay (quick menu)
VOX Gain (pot on side panel)
Anti-VOX (pot on side panel)

Have played with various combinations but to no avail ... have tried both the IC stock mic, and a heil headset ... using dummy load & low power while testing.

Any tips on debugging, or procedure (e.g. setting everything all the way one way) to start out and find the right setting?
Possible culprits? (the relay rclick re-triggering? RF? etc)"

I am having the same problem with my Icom 706MKII, running it into a dummy load, with the Icom PTT mic. Has anyone figured out the solution to this problem yet?

73 John AF5CC

# 20664. Icom 706MKII VOX problem

Yahoo group: ic706 (2010 — 2015)
Date: 2013-07-28 21:37:17 UTC
From: John Geiger
Topic: 20664  Message: 20664

I was trying VOX today on an Icom 706MKII that I recently picked up, getting it ready for the digital modes. With the Icom HM-118TM (the TTP mic) whenever I would speak it would go into transmit, as VOX should. However, when I stopped speaking it would continue to rapidly switch between transmit and receive, as VOX shouldn't. I tried adjusting the VOX gain and ANTI VOX controls with no luck, other than it wouldn't go into transmit at all with the VOX gain at minimum. Also, adjusting the VOX delay made no difference.

Anyone seen this problem before or have an idea as to what is going on? I am sure I just have something set wrong.

Only one mic plugged in at a time?

On google I saw some comments regarding RFI and the separation cable.
Mic gain also may be super sensitive.

I've never used vox myself.

Any kind of fan or noise in background?

Sounds like you intend to use the mic port for digital soundcard modes via VOX.

Why not use the 13-pin DIN ACC port on the rear and avoid the VOX issue?

That's what I do with one of my 706s that I use for digital soundcard modes.

Or is the ACCESSORY port already tied-up?

Hi Mike,

It does the same thing using a cable between the mic jack and the computer soundcard, so it isn't picking up any extraenous noise from the fans or the environment. This used to work fine with my 706 original.

Only one mic plugged in at a time?

On google I saw some comments regarding RFI and the separation cable.
Mic gain also may be super sensitive.

I've never used vox myself.

Any kind of fan or noise in background?

Hi Larry,

Yes, I am going to use the mic jack for the digital modes, as I already have a cable made up for it, so there is no cost as a digital modes interface would be $50 or so, and also, my laptop doesn't have any serial ports, so I would have to get a USB to serial converter which is another $20 or so. This worked fine with the 706 original I used to have, not sure why the MKII is having this problem.

Sounds like you intend to use the mic port for digital soundcard modes via VOX.

Why not use the 13-pin DIN ACC port on the rear and avoid the VOX issue?

That's what I do with one of my 706s that I use for digital soundcard modes.

Or is the ACCESSORY port already tied-up?

That is a common problem with the 706. You have a bad capacitor in
the unit. If you go through the archives, you
will find the solution. In the meantime I'll check my files and see
if I kept anything. I had the same problem..

Still a bit unclear on what you are intending to do.

Are you planning on running the mic/speaker input/output lines from the PC directly to the mic jack without ANY interface?

I know that Skip Teller had a couple of kits out to make a very inexpensive interface (with isolation) between the PC, usually around $20.00, one of which when to the RJ-45 mic port, and the other used the 13-pin DIN ACCESSORY port. (I have both floating around somewhere.)

The same functions of the rig that are available on the RJ-45 mic port are available on the 13-pin DIN ACC port (plus much more!).

You can buy a 13-pin DIN plug for less than $5.00 (which leaves the issue of soldering lines to those pins!), or, if you've got the original accessories that came with an IC-706 or IC-706MKII, ICOM furnished a 13-pin DIN Plug with "pigtails" already soldered to those 13 pins.

Bottom line: it's fully possible to use the 13-pin DIN ACCESSORY port for digital soundcard modes on the 706s without incurring the expenses mentioned below.

In any event, hope it works out for you.

There is no VOX sensing on the rear mic input. This is why the most basic of interface is best used on the RJ-45 connector. Nothing more than attenuating resistors on the radio mic input, cables, and connectors are needed for digital modes.

# 20672. RE: EXTERNAL: Re: [ic706] Icom 706MKII VOX problem

Yahoo group: ic706 (2010 — 2015)
Date: 2013-07-29 17:28:36 UTC
From: LARRY J. FORD
Topic: 20664  Message: 20672

I KNOW there is no VOX on the rear ACCESSORY Port and didn't say there was.

I was trying to suggest using the ACCESSORY port as an alternative to the RJ-45 mic port, as VOX is not the only way to use soundcard digital modes, and, in fact, VOX-triggered TX for soundcard digital modes is the least desirable of available methods.

Sometimes the "minimalist" approach is not the best approach, especially when it comes to soundcard digital modes.

# 20675. Repairs needed to a Mk 1 radio

Yahoo group: ic706 (2010 — 2015)
Date: 2013-07-29 18:55:03 UTC
From: Michael Buckley
Topic: 20675  Message: 20675

I have a Mk 1 set with the AAMU but have not been able to make it work, so decided to invest in a visit to Martyn Lynch.

(Such a helpful lot!)

Well I got the usual friendly approach but not a repair as it seems that the AAMU works fine with another mk2 set using my lead so that clears up that bit,

The set works fine by itself with 100W output where it should
It seems that there is some problem with the logic board that should communicate with the AAMU, and doesnt, as I get the loud tuning noise all the time.

Has anybody any suggestions, ( except for using manual tuning!) or live close enough to Croydon or Wimborne, or a line between each, to offer to look at it?

Many thanks

Mike

Hi Doug,

Thanks for the info, I will look it up. Any idea what would make the cap go bad? Wonder if it is something I did or if it was like this when I got it.

That is a common problem with the 706. You have a bad capacitor in
the unit. If you go through the archives, you
will find the solution. In the meantime I'll check my files and see
if I kept anything. I had the same problem..

From: John Geiger
Topic: 20664  Message: 20677

Hi Larry,

Yes, I am hoping to run a cable from the soundcard to the mic jack using a CAT-5 cable with a couple of 1/8" jacks for the soundcard. I have done this before with a 706 original I had and it worked great. Just turn on the VOX and you don't need to worry about PTT switching. If I use the 13 pin accessory jack in the back, then you have to use PTT switching, which at the minimum would require a USB to serial converter since my laptop doesn't have serial ports.

Still a bit unclear on what you are intending to do.

Are you planning on running the mic/speaker input/output lines from the PC directly to the mic jack without ANY interface?

I know that Skip Teller had a couple of kits out to make a very inexpensive interface (with isolation) between the PC, usually around $20.00, one of which when to the RJ-45 mic port, and the other used the 13-pin DIN ACCESSORY port. (I have both floating around somewhere.)

The same functions of the rig that are available on the RJ-45 mic port are available on the 13-pin DIN ACC port (plus much more!).

You can buy a 13-pin DIN plug for less than $5.00 (which leaves the issue of soldering lines to those pins!), or, if you've got the original accessories that came with an IC-706 or IC-706MKII, ICOM furnished a 13-pin DIN Plug with "pigtails" already soldered to those 13 pins.

Bottom line: it's fully possible to use the 13-pin DIN ACCESSORY port for digital soundcard modes on the 706s without incurring the expenses mentioned below.

In any event, hope it works out for you.

John Geiger wrote: "If I use the 13 pin accessory jack in the back, then you have to use PTT switching, which at the minimum would require a USB to serial converter since my laptop doesn't have serial ports."

Not exactly. No serial port required, with the proper design. One of Skip Teller's (KH6TY)later kit designs of an soundcard interface connected directly to the mic/speaker jacks on the PC, provided isolation on the audio lines to/from the rig, but didn't use VOX and didn't use a serial port on the PC side either. It used a circuit which switched on a transistor which in turn pulled down the transceiver PTT line. The 13-pin DIN ACC port has that PTT line on it, as well as the other lines needed by that interface.

His earlier published design used a VOX circuit, but not the one I'm talking about. One big advantage of both designs is audio isolation.

However, you seem to have your mind set on a particular arrangement, so I hope it works out for you, assuming you can solve the VOX issue.

Hi Larry,

I was unaware of that design. Something to definitely look into. Sounds like it would be similar to the Signalink SL-1 which had a switching circuit built into it.

Thanks for the information .

I think you missed it. But any way, I dug into my file and the
culprit was C467.
It is a filter cap in the mic bias line. If you have the schematics you should
be able to find it. It is located very close to the two IF filters. I
didn't change it
myself, I had a another chap who had a soldering station do it for
me. I think he use
used a hot air soldering station. I used an ordinary cap bought from
a local parts
store. Couldn't get an original up here in the "Great White North". I
hope you have
a Service manual with all the parts locations.

What was happening, the capacitor must of dried out and it was
allowing a spike into
the vox cct. I also have a MIIG but have had no problems with it.

Here is the message I received from Scott Malcom at MTS about the cause of the VOX problem I was experiencing.

HI John:
Yup, it is usually a electrolytic on the Main unit right next to the front interconnect (mylar) flex cable.

On 7/29/2013 12:49 PM, John Geiger wrote:
Hi Scott,

I have an Icom 706MKII which is a nice radio and it works great except for the VOX circuit on it. When using VOX, it won't return to receive when you are done talking. Instead it rapidly cycles between transmit and receive. I see from some internet searches that other 706MKII owners have this problem as well. I don't know if it occurs in the 706 original or MKIIG.

One ham on the ic706@yahoogroups.com reflector said that it is a blown capacitor in the rig. Are you familiar with this problem and is that the cause of it?

Thanks Doug, will look into that.

I have figured out a work around for the lack of VOX and RTTY for right now, though.

# 20686. MKIIG Volume/IF Passband issue

Yahoo group: ic706 (2010 — 2015)
Date: 2013-08-07 01:49:07 UTC
From: Justin
Topic: 20686  Message: 20686

First ever post to a group like this, so forgive any faux pas.

The short version of the story is that once upon a time, I dropped my MKIIG from a computer desk. This sheared off the Vol/Gain-Sql pot off of the VR board. I ordered/replaced the pot, but discovered that the portion of the front panel that retained and stabilized it had come off with it.

Fast forward about 9 months. My radio has been experiencing a condition where the Volume (and RF gain) becomes set to max, and the IF passband pegs to one side or the other (dependent on whether it's in USB or LSB). It was intermittent, and could be fixed by thwacking (technical term) the volume knob until it came back.

Today, the condition has come again, and it seems to be permanently set. I took apart the front panel, and through some tricky handling, powered the radio up with the display board in my hand, and I attached/removed the VR board. There was no symptom change. Without digging into the manuals (don't have time, I'm working on the road), I suspect that the ribbon cable between the VR and display boards has failed, and I am seeing the result of the radio believing all of the pots are at max (open). I'm stuck without a multimeter for the night, but I'll have one tomorrow, and I'll ohm out the cable then.

Is this a reasonable assumption? Have any of you out there in 706 land experienced a similar issue? Does anybody out there have a junker 706 with a ribbon cable part number E41447-K 2897 VW-1 that they'd be willing to put in an envelope for me? I'd appreciate any advice.

Thanks, and 73!

Justin, KK4LSM (/6)

# 20687. Running mobile with some CW problems

Yahoo group: ic706 (2010 — 2015)
Date: 2013-08-06 21:36:48 UTC
From: John Geiger
Topic: 20687  Message: 20687

I was running my Icom 706MKII mobile over the past few days and made quite a few QSOs on the County Hunters Net. However, 2 interesting things showed up, that I am looking for solutions for. I had my 706 plugged into the cigarette lighter on a 2007 Chrysler Town and Country Minivan. The cables were 10 or 12 guage so there shouldn't have been much voltage drop. The antenna was a MFJ mini hamstick (3 feet tall on a 5 inch mag mount) for 20 meters. I had the rig set to 40 watts due to the current limitations of the cigarette lighter.

The first thing I noticed was that I was getting RF bites off of the set up MFJ mini travel paddles I was using. Also off of the rig case at times. This is intersting because it didn't happen last month when I was using a Yaesu FT857 with the same setup. The only difference was that the paddles have a 1/8" plug on the end, so they plugged directly into the FT857's key jack, whereas I had to use a 1/8' to 1/4" adaptor for the key jack on the Icom 706MKII. Don't know if the adaptor could cause something like that.

Secondly, a couple of stations told me I had a chirp on my signal, like the battery was low. I didn't get this report when the FT857 either, running at around the same power, nor with an Icom 706 original I used to have. Could the 706mKII be more sensitive to lower voltages?

I wonder if others have experienced these problems with their 7-6s or have an idea as to what could be going on with my setup.

From: LARRY J. FORD
Topic: 20687  Message: 20688

ICOM 706s are indeed very sensitive to voltage drops, especially on SSB (it will grossly distort the audio). I run a ICOM IC-706MKII mobile, but to avoid what you are experiencing I use the MFJ-706 EMCOMM "box" bolted down to power from a 12-volt socket in my Honda CR-V because the MFJ-706 has a bank of capacitors built-in to provide the current needed when you key down at 100 watts and avoid drawing too much current through that 12-volt socket.

That works OK when the engine is running, but it does not boost the voltage, and I get a voltage drop when the engine is off and even when the engine is idling (shouldn't, with an alternator, but it does). [Yes, I have been TOO lazy to do a proper mobile install, with the power leads run all the way back to the battery, and a good chassis ground from the rig to the car body!]

Regarding those 12-volt socket, you don't know (unless you've gotten "under the hood," so to speak) what gauge wiring supplies the socket from the car's bus (I doubt it's wired directly back to the battery), so a high current draw in undersized wiring will likely produce a voltage drop to the rig, at least to my understanding of such matters.

And, finally, a 3-feet tall antenna on 20 meters???? Must be a big loading coil at the base of that little sucker? Did you check the SWR?

# 20689. Re: [ic706] Running mobile with some CW problems

Yahoo group: ic706 (2010 — 2015)
Date: 2013-08-07 15:11:00 UTC
From: Ralph Mowery
Topic: 20687  Message: 20689

The chirp may be due to voltage drop.  The 706 has a problem in that no mater how low the power is set, it will still try to put out 100 watts for a fraction of a second when first switched to transmitt.

Alos trying to run an antenna for the low bands with a mag mount is asking for trouble. The mag mount is not large enough to couple to the body of a car, so much of the antenna current will try to follow the coax back to the rig.

Some Icom 706 rigs have problems with internal grounding.  This can show up, especially if the antenna system is not up to stuff.

# 20691. External Speaker

Yahoo group: ic706 (2010 — 2015)
Date: 2013-08-10 17:53:35 UTC
From: sv_maitairoa
Topic: 1044  Message: 20691

Just installed a Icom 706 MKIIG and planned to use an external speaker made by Am-Com Inc. Model # CSS-1 (Clear Speech Speaker) with noise filter.

Works great during receive but when I transmit it back feeds thru the speaker.

Any fix for this? Would hate to not be able to use this speaker.

Thanks

I had that problem with the internal speaker using a mag mount on 20m.
Chokes on the coax cured it.

Some amplified speakers are more problem than others. I've found 17 and sometimes 15 to be problems sometimes only 17 and or 15. Antenna farther away helps too.

I also had the same problem especially on 17 & 15m. Winding a few turns of the cable around a small toroid solved it for me (as close to the Plug as possible), if that doesn't totally eliminate it a de-coupling capacitor across the Speaker may also help (I have seen some Speakers that have these fitted already).

How much capacitance does the MFJ-706 have Larry?

I frequently have to run the engine to use SSB for Pactor. I have a good supply to a good battery bank, but the transients eat up enough of the available volts to disable comms. Might be practical for me to add the capacitance.

I recall Phil Salas' review saying it had 4 farads of capacitance, although the MFJ product website says only "several" farads:
http://www.mfjenterprises.com/Product.php?productid=MFJ-706

Manual is here: http://www.mfjenterprises.com/pdffiles/MFJ-706.pdf

Phil's review is here:
http://www.ad5x.com/images/Presentations/MFJ706%20Review%20RevA.pdf

"...a 4-FARAD bank of super capacitors which supplies the peak current needed for low duty cycle SSB and CW modes."

As a surprising plus, the built-in autotuner in the MFJ-706 is quite effective, plugs right into the ICOM tuner connector on the back of the 706, and does a good job of extending the tuning range of a 40-meter Hamstick and 40 and 80 meter Hustlers.

I doubt I would pay the retail price MJF wants for a new unit, but I got a good deal on the one I bought.

Thanks to the group for all the feedback. Adding a ferrite around the plug fixed the problem. I only had one around the power lead before.

# 20698. Dead 706 mk2g

Yahoo group: ic706 (2010 — 2015)
Date: 2013-08-13 20:13:47 UTC
From: Trevor M1CXF
Topic: 20698  Message: 20698

I have just been out in my van and found my 706 mk2g is dead. I dug the rig out from its normal place and tried to switch it on with the head unit directly fitted to rule out any remote cable problems. I have checked the fuses and even had the lid off and checked that there was 12 volt making it into the unit. All of these checks have been fine but still a dead rig. No clicks or any other sounds come from the unit when disconnecting or reconnecting power.
Has anyone got a clue where I should check next?

Regards

Trevor (M1CXF)

This seems to be a common proble with the 706.  I had that problem and sent it to  be repaired.

Look at this:
http://www.youtube.com/watch?v=CCGF1BJsRko

While yours will not go  off and on , it is probably the same repair.

There is a capacitor that seems to go bad and leak on the circuit board and eat up the traces on the circuit board.

If you do a search on the internet you can find places where others have rfepaired the board.

I have now had oppertunity to remove the radio and put it on the bench to find that it matches the video clip. I couldn't hear the clicking because of where it is fitted in my vehicle. Upon further investigation I have so far found one blown capacitor and hopefully I have got to it before it has rotted anything else. So for the price of a cap and a little of my time I hope to fix the radio soon. Why any radio is built with such an inherent fault is beyond me!

Several years ago -- and perhaps at the time your rig was built -- a huge number of faulty electrolytic capacitors were showing up in all kinds of products: computer motherboards were a common victim. So the problem with your rig might have resulted from a faulty component rather than from a design fault.

Are you saying the ICOM engineers designed it that way?

Any manufacturer can inadvertently get delivery of a bad run of any component.

Plus, unless you've owned it since it was new, who knows what conditions it was subjected to before you got it. Components can and do go bad all the time.

I've got an original IC-706 and an IC-706MKII, neither of which have (thankfully) suffered this "fault," so I suppose the fault is not necessarily "inherent."

Glad you got it fixed easily.

Yes and just how old is that radio?
I bet one bought today won't have the same track record.

Is it a 706 original? I never had one of the originals. I did have the problem of knocking the tone off by accidentally moving the vfo.

The 706 original and the 706MKII do not have automatic repeater setups. You have to set the split and offset in one of the startup menus (turn radio on while holding down the lock key), and then choose the repeater function when you get to the correct receive frequency.

Yes, but I have figured everything else out except how to hit the local repeater. 145.35 -600 and 67. I can receive the repeater, and get the transmitter to shift down 600, but I think the tone is not going out to key the repeater.
Any suggestions are welcome

I have always just followed the manual procedure for setting up and storing a repeater in a memory channel.

The Tone can be set in the "Quick Set Menu."

However, you have to make sure you do the "Memory Write" function to store the repeater parameters in a vacant memory slot.

I don't have access to the manual at this moment.

Is it an "original" 706 or a 706MKII or 706MKIIG?

On the II and the g and I presume the original, you must see FM-T in the display or its not transmitting tone.

You'll want a memory for it. If you bump the vfo it may change to fm no tone. A memory allows quick return.

# 20712. FS: Icom 706MKII HF/6m/2m transceiver

Yahoo group: ic706 (2010 — 2015)
Date: 2013-08-20 22:11:07 UTC
From: John Geiger
Topic: 20712  Message: 20712

I have for sale an Icom 706MKII HF/6m/2m transceiver with the UT-106 DSP unit installed. It does 100 watts on HF and 6m and around 25 watts on 2m. The case is in pretty good condition with a couple of rough spots near the SO239 connector on the rear. Also, some of the paint has worn off the metal rim around the back of the faceplate, but overall it looks pretty good. It has great receive and does full power out. It does act a little finicky on VOX at times, but other than that, works great. It comes with the HM-100N hand mic, a 3 foot long power cord terminated in Anderson power poles, and a copy of the manual. I have worked 45 countries with this rig in the past month, so it is doing great.

I am asking $415 plus shipping for it. I can take paypal/check/MO or cash. I like this rig alot but just replaced it with something that does UHF as well so I can get back on the satellites.

If you needed one, and didn't have it, it might be worth more as the radio is a nice paper weight without it!

Still, the price is about one-half of what original 706s typically bring.

If I were going to definitely keep my original 706, I might buy for "insurance," but I'm thinking seriously of selling my 706 and 706MKII and applying the proceeds toward the new IC-7100.

I found that I have power output in usb, cw, but no power out in fm or fm t mode.
Swr looks fine. Has anyone experienced this problem?
This is the reason I can't hit the local repeaters, but can receive them with no problem.
Any ideas are welcome.
Mike Mosier

There is a small varitable capacitor that has been known to give problems. It may not be soldered in correctly or it may just need adjustment.  Go to
www.mods.dk

The capacitor is for the FM VCO.
From what I have read, it only effects the FM transmitt.
There is a photo of where this is at on the web site.  Here is a copy and past of what needs to be done.

Procedure;1. Turn transceiver off and disconnect all leads. (Obvious?)
2. Using a Phillips-head driver remove top cover only.
3. With radio upright & front facing towards you (ie; normal operating position) the MAIN Unit PBA is the front board.
4. Locate the 9.0115 MHz IF filter and then C267 (identified on silkscreen) 9mm to the right of the filter.
5. Using fresh solder, carefully re-touch up solder joints to both pins of the trimmer cap. The filter side is difficult to solder due to nearby capacitors and the fact that the ground plane will sink a lot of heat.This is the pin that is usually not soldered properly ex the factory.6. Inspect solder joints carefully, particularly the ground plane side.
7. Re-connect DC Power lead.
8. Connect Dummy Load via a PWR meter.
9. Turn the transceiver on, select FM mode, and select a convenient test frequency, ie; 29.6MHz.
10. Confirm TX carrier frequency is correct against Frequency Counter (or another receiver).
11. Check Power O/P is appropriate to the PWR setting in the menu.
12. If all ok, turn off and replace the top cover.
It is most unlikely you will need to tweak C267.
The setting should still be correct, otherwise alignment is not that critical, just set it for centre of lock range.
Needless to

From: Al Waschka
Topic: 20722  Message: 20723

If you are interested in a screwdriver, I have a High Sierra HS-1500 that I replaced with a Tarheel. I got the Tarheel at a hamfest since I didn't want to be without an antenna while I repainted the High Sierra and I wanted to have the turns counting switch to work with an automatic controller. The High Sierra does not have the switch.

It was working when I removed it, but could use some cleanup. I refurbished it when I bought it from eBay several years ago. The top coil wire was broken, so to reconnect it I removed a couple of turns but it still hits 75 with a 6' whip no problem. When I refurbished it, I stripped it down to piece parts, and had all the metal parts powder coated. I also replaced the flimsy High Sierra sleeve with an acrylic tube and have another spare piece that I will throw in. On the antenna itself, the powder coat is bubbling in a few places and the mount needs to be stripped and repainted. I replaced the motor after using it for a while, so the motor is only about 2 years old.

Electrically, it is fine. I noticed no difference in field strength when I compared the new Tarheel to the High Sierra, and signal reports are consistent as well. I will sell it with the original controller switch and a whip, all you would have to do is get a mount and run some two conductor wire (lamp cord would be fine) to run from the front of the car/truck to the mount.

They do require a strong mount. I had one made up from aluminum box and tube and bolted it to the frame using the bumper mounting bolts.

If interested, I'd like to get $175 for it plus shipping. I'll take and send some pictures if interested.

Al K5TAN

Giga-Parts has a number these antennas on their website for about $15.00 each.

There is a small varitable capacitor that has been known to give problems. It may not be soldered in correctly or it may just need adjustment. Go to
www.mods.dk

The capacitor is for the FM VCO.
From what I have read, it only effects the FM transmitt.
There is a photo of where this is at on the web site. Here is a copy and past of what needs to be done.

Procedure;1. Turn transceiver off and disconnect all leads. (Obvious?)
2. Using a Phillips-head driver remove top cover only.
3. With radio upright & front facing towards you (ie; normal operating position) the MAIN Unit PBA is the front board.
4. Locate the 9.0115 MHz IF filter and then C267 (identified on silkscreen) 9mm to the right of the filter.
5. Using fresh solder, carefully re-touch up solder joints to both pins of the trimmer cap. The filter side is difficult to solder due to nearby capacitors and the fact that the ground plane will sink a lot of heat.This is the pin that is usually not soldered properly ex the factory.6. Inspect solder joints carefully, particularly the ground plane side.
7. Re-connect DC Power lead.
8. Connect Dummy Load via a PWR meter.

9. Turn the transceiver on, select FM mode, and select a convenient test frequency, ie; 29.6MHz.
10. Confirm TX carrier frequency is correct against Frequency Counter (or another receiver).
11. Check Power O/P is appropriate to the PWR setting in the menu.
12. If all ok, turn off and replace the top cover.
It is most unlikely you will need to tweak C267.
The setting should still be correct, otherwise alignment is not that critical, just set it for centre of lock range.
Needless to

These are Jetstream and MFJ single band antennas. I use a 40m Hamstick on my vehicle and it works great. Have not had much luck with the 75-80m version - probably due to the location of the antenna - right behind the tailgate of my SUV.

I can also vouch to better than expected results with the 40-meter "Hamstick" which I have on a Hustler stainless steel spring mounted on a Diamond K-400 mount attached about half-way up the rear hatch door on my 2011 Honda CR-V.

I'm feeding it with an IC-706MKII mounted in the MFJ-706 EMCOMM box strapped in the rear cargo area right next to the hatch door. The autotuner built into the MFJ-706 EMCOMM box gives a surprising range of matches from 6.9xx MHz (for non-amateur, but still "legal" purposes) to 7.3xx MHz (ditto). It also does a fine job on the mobile 40 meter Nets between 7.251 and 7.258.

I have also had similar success with the 40 meter Hustler resonator mounted on a 57-inch Hustler folding mast on the CR-V, with the same set-up, but the Hamstick offers less wind resistance and, frankly, "looks" better mounted on the back of the car.

# 20733. 706 & 706mk2 differences

Yahoo group: ic706 (2010 — 2015)
Date: 2013-09-04 16:01:52 UTC
From: radiow4ron
Topic: 20733  Message: 20733

I wonder if someone can tell me the differences between the
original 706 and the 706mk2?
I bought a 706 at the Shelby hamfest Saturday to go in my my
car for HF mobile, I have a Mk2 in the shack and love it,
I'm just wondering what the main differences between them are?
The first thing I notice is the location of the memory selector
switch not being the same, what else is different?

Thanks a bunch.

Just what I have noticed....I did the reverse of you. My 706 failed and I bought a MkII to replace it.

1. As you have noticed, the RIT knob acts as a memory selector in memory mode when enabled as such in the setup menus.
2. Option to instal the DSP module to get noise reduction and automatic notch filter. Automatic notch works great, noise reduction is only so-so and reduces audio level when enabled.
3. Compressor, if on in HF, is off in VHF.

I'm sure there is more, but I haven't run across it yet.

# 20735. Re: [ic706] 706 & 706mk2 differences

Yahoo group: ic706 (2010 — 2015)
Date: 2013-09-04 17:44:18 UTC
From: John Geiger
Topic: 20733  Message: 20735

I was thinking of these very same differences just last night. I have had both radios and both are very pretty good performers for their respective prices, and a lot of fun to use. Here are the differences I came up with:

1. The original has 1 filter slot, the MKII has two filter slots.

2. The MKII can be fitted with the UT-106 DSP module (later models came with it as standard. Icom referred to these radios as the 706MKII-15 in their literature at the time). The original cannot be fitted with the DSP board.

3. The original puts out 10 watts on 2m, the MKII puts out 20 watts.

4. The MKII has dedicated up/down band buttons. The original uses these buttons to select the memory channel. You have to change bands using the TS button and the main dial.

5. The MKII has both RTTY and RTTY-R as selectable modes. The original only has RTTY. On the original, you get to RTTY by pressing and holding the mode button when in AM mode. On the MKII, pressing and holding the mode button toggles between AM, FM and WFM modes.

6. On the MKII, preamp or attenuator settings are stored by band, meaning you can turn on the preamp when on 10m and turn it off for 20m, and next time you go from 10m (preamp on) to 20m, the preamp will be off. On the original, it did not do this. If you turn the preamp on and switch bands, the preamp will stay on. Same for the attenuator settings.

7. On the MKII when running split, you can have the VFOs set for different filter settings. For example, when chasing DX on CW, you might have VFO A as the receive VFO, and set to 500hz to best hear the DX. VFO B is the transmit VFO, but you can turn off the CW filter so when you use the XFC button to find the station the DX is working, you have a wider bandwidth to listen around with. On the original, both VFOs have to use the same filter setting, even with running split frequency.

8. The MKII will let you operate split between 2 different bands. This would be useful for working Oscar 7 when it is in Mode A (2m up, 10m down). The original won't let you do this. I still made a few Mode A QSOs but had to manually switch between VFOs.

9. The MKII is more sensitive with the preamp off. However, I though the original was about the right sensitivity on the lower bands with the preamp off.

10. The MKII has better sensitivity outside the 2m band for public service frequencies. You had to clip a wire in the original to increase

the sensitivity in these areas.

11. The fan runs all of the time on the 706 original (a good thing), whereas the fan only runs during transmit or when the radio reaches a certain temperature on the MKII, unless you do a mod.

12. The original has more heatsink material on the back of the radio.

13. The MKII is supposed to have a larger speaker and better audio output (according to QST). I never noticed a problem with the audio output on the original.

That is what I can think of right now. There are probably a couple of other differences I have forgotten about.

Topic: 20733  Message: 20736

John,

Good list!

In addition to what you have mentioned, with a 706MKII and an AH-4 auto tuner, you can tune a 6-meter frequency because the 706MKII has the required firmware to control the AH-4 on 6 meters embedded in the microprocessor.

The 706 does not, therefore you can't tune on 6 meters with the AH-4.

Seems like there was something else, but can't remember it now.

I have a 706MKII that I run mobile and an "original" 706 that I use as a back-up HF in the shack, so perhaps that additional difference will reveal itself sooner or later!

From: Eric Mynes
Topic: 20733  Message: 20737

The 706MKII has 100w out on 6m whereas, the 706 (original) doesn't do that much. That was the deciding factor I used when I bought my 706MKII.

From: LARRY J. FORD
Topic: 20733  Message: 20738

If it were me, I'd swap the two (I run a 706MKII mobile with an original 706 in the shack for back-up to my 7200), especially if the MKII has the DSP module installed.

Although it's AF DSP, and not IF DSP (like on the 7200 and above), it's better than nothing and the auto notch filter actually works OK.

The AF DSP module cannot be installed on the original 706, so I've used the stand-alone JPS NIR-12 AF DSP unit with the 706 in the shack, which would be a little bulky for mobile use.

Just my .02 worth, YMMV.

I have never had any problem getting 100 watts out on 6m with the 706
original I had.

There are several mods. One is just a wire cut. The out-of-band sensitivity on that one is not very good. I had to be within a 1/2 mile of my local weather station to hear it.

The one you want is
http://vss.pl/mods.dk/mods.php3-radio=icom&model=ic-706&selectid=all.htm#235

The specs is 100  watts except 40 watts AM for all bands excpet 2 meters where it is 10 watts and 4 am for the origional or first version of the 706.

Later versions bumped up the 2 meter power  and then added then 440 mhz band on the llG.

When I had my original 706, I did the mod where you remove a cap & stack it on top of another one.  REALLY did a good job for receiving NOAA, marine freqs, etc. above the 2m band.

I have an original 706. The Service Manual specs for HF/50 MHz are:

"SSB, CW, FM, RTTY 5 - 100 W
AM 2- 40 W"

Sounds like someone read the manual wrong, or forgot what mode they were in when they checked the wattmeter!

I can also vouch to better than expected results with the 40-meter "Hamstick" which I have on a Hustler stainless steel spring mounted on a Diamond K-400 mount attached about half-way up the rear hatch door on my 2011 Honda CR-V.

I'm feeding it with an IC-706MKII mounted in the MFJ-706 EMCOMM box strapped in the rear cargo area right next to the hatch door. The autotuner built into the MFJ-706 EMCOMM box gives a surprising range of matches from 6.9xx MHz (for non-amateur, but still "legal" purposes) to 7.3xx MHz (ditto). It also does a fine job on the mobile 40 meter Nets between 7.251 and 7.258.

I have also had similar success with the 40 meter Hustler resonator mounted on a 57-inch Hustler folding mast on the CR-V, with the same set-up, but the Hamstick offers less wind resistance and, frankly, "looks" better mounted on the back of the car.

# 20750. Programing IC-706 Memories from a PC

Yahoo group: ic706 (2010 — 2015)
Date: 2013-09-14 15:54:34 UTC
From: Al Waschka
Topic: 20733  Message: 20750

I stumbled across this on the CHIRP reflector, where someone was asking about programming the 706 memories. I think I have seem similar questions here. I was interested because I put a lot of time into programming my 706 mobile rig from the front panel and was looking for an easier way to duplicate the loads in my 706MkII which is replacing the 706.

The logging program YPlog has the capability to read and write memories in the 706 family of radios (among others). There are a few subtleties I have deduced from my limited experiments.

1. The memory data table is not editable by common techniques such as COPY, CUT, and PASTE. You may only enter and delete data in single fields.
2. You can program memories as splits for repeaters by loading a TX OFFSET, however, contrary to the HELP file's claim, entering 600k will not set the split to 600 kHz. One must use 0.6 (as in MHz).
3. YPlog can WRITE offsets to the radio but does not READ offsets from the radio.
4. Memories P1 and P2 in the radio are 100 and 101 in YPlog and the calling channel is 102.
5. The radio indicates that a tone is loaded into all memories where FM mode is programmed. I'm guessing that they are all loaded with the tone that is set in the radio's menu.

I used a Timewave HamLinkUSB cable, with the appropriate driver, of course.

Hope this is useful news. It was for me.

# 20751. FL-94 & FL-23 center Frequency?

Yahoo group: ic706 (2010 — 2015)
Date: 2013-09-15 06:53:41 UTC
From: <john37537@...>
Topic: 20751  Message: 20751

Can someone tell me the center frequency of the FL-94 (FI681) and the FL-23 (FI561) crystal filters in this 706mk2G?
I need to order and replace them because they rusted away due to someone spilt soda in the radio. Icom said they are discontinued items.
The FL-272 (FI671) is the SSB filter and it is marked 9.0115MHz, (2.4KHz/-6db).
I've discovered the FL-94 has poles at (8KHz/-6db) and the FL-23 has poles at (15KHz/-6db) but I need to know their center frequencies!
Anyone?
Thanks, John

# 20752. RE: FL-94 & FL-23 center Frequency?

Topic: 20751  Message: 20752

FI561 (FL-23) is shown on the service manual as centred on 9.0115MHz and used as a bandpass filter for the 2nd mixer circuit. Downstream of this are FI671, which you identify as 9.0115MHz, and used for SSB and CW. FI681 is in a similar position, in terms of signal path, to FI671, and is used for AM and FM-N. The 2nd IF for AM and FM-N is given as 9.0100MHz so FI681 might well be centred on 9.0100MHz. They're also given as part numbers 9M8A and 9M15A, respectively. A pair of these filters were recently sold on eBay.

From: <john37537@...>
Topic: 20751  Message: 20753

voip10,
Thanks for your reply!
I saw that expired Ebay add. Would like to have got it. But I'm too late. That add is where I learned the slope of the two filters, but they never did mention the center frequency for each. They just said 9MHz.
Since Icom tells me they've discontinued them, so I need to order them elsewhere. I'm sure I'll need to know the center freq, slope, perhaps impeadance for the order.
So you think FL-23 is 9.0115MHz and FL-94 is 9.0100MHz ?

I'll go with that unless someone else knows otherwise?

Thanks again, 73,
John

From: Vincent
Topic: 20733  Message: 20755

Hello All,
Re: Al's e-mail below, I looked online and noticed that programming cables for the IC-706 are readily available at a reasonable price.
However, it looks like the YPlog Program costs quite a bit unless you download the Spamware version?  I am just interested in programming the radio without
the control and logging functions.  Does anyone know of a software program that is free or inexpensive that will program the IC-706?
Thanks,
Kevin

I don't know what you mean by the "spamware vesion". I downloaded a shareware version (from here: http://www.qsl.net/ve6yp/) that works, doesn't have ads, and my virus checker says is OK. It says you must register it to get certain functions, none of which are required to program the 706.

Hello All,
Re: Al's e-mail below, I looked online and noticed that programming cables for the IC-706 are readily available at a reasonable price.
However, it looks like the YPlog Program costs quite a bit unless you download the Spamware version? I am just interested in programming the radio without
the control and logging functions. Does anyone know of a software program that is free or inexpensive that will program the IC-706?
Thanks,
Kevin

Subject: [ic706] Programing IC-706 Memories from a PC

I stumbled across this on the CHIRP reflector, where someone was asking about programming the 706 memories. I think I have seem similar questions here. I was interested because I put a lot of time into programming my 706 mobile rig from the front panel and was looking for an easier way to duplicate the loads in my 706MkII which is replacing the 706.

The logging program YPlog has the capability to read and write memories in the 706 family of radios (among others). There are a few subtleties I have deduced from my limited experiments.

1. The memory data table is not editable by common techniques such as COPY, CUT, and PASTE. You may only enter and delete data in single fields.
2. You can program memories as splits for repeaters by loading a TX OFFSET, however, contrary to the HELP file's claim, entering 600k will not set the split to 600 kHz. One must use 0.6 (as in MHz).

3. YPlog can WRITE offsets to the radio but does not READ offsets from the radio.
4. Memories P1 and P2 in the radio are 100 and 101 in YPlog and the calling channel is 102.
5. The radio indicates that a tone is loaded into all memories where FM mode is programmed. I'm guessing that they are all loaded with the tone that is set in the radio's menu.

I used a Timewave HamLinkUSB cable, with the appropriate driver, of course.

Hope this is useful news. It was for me.

It should be pretty accurate on HF only. I like a cross needle meter for tuning in the shack, haven't used a screwdriver.

Not very, and yes. I used the internal SWR meter to match a single band antenna to the center of a band. Using and external meter and antenna analyzer several years later, I found the antenna to be off about 2.5 MHz. The 706MKIIg still claimed it was perfect.

I use mine routinely with an MFJ controller and an ATAS 100 and it works
well enough to get me to minimum swr with little difficulty.

Kind of surprised by the number of folks with issues about it, but it can't hurt to try it
first and see if you like it well enough.

Why not put a known, good SWR meter inline, downstream of the 706 and compare readings.

Even if the meters in 706MKIIGs were, as a general rule, accurate, that does not mean yours is.

Testing against a known, standard reference will verify what your meter reads.

Don't go tuning your screwdriver antenna with the 706
at full output. You will fry the filter board and possibly the finals.
I respectfully suggest using an antenna anaylizer to mark settings.

I tune for receiver noise first, then tune in AM - only 40W. I'm planning
to hook up a relay so that when the antenna tune voltage is applied it puts
the 706 in tune mode - only 10W, but haven't got that built yet.

# 20767. 706 Tuning Interfaces (was: SWR Question)

Yahoo group: ic706 (2010 — 2015)
Date: 2013-09-18 14:47:43 UTC
From: LARRY J. FORD
Topic: 20767  Message: 20767

Or, if the 4-pin Molex tuner connector on the back that an AH-4 normally plugs into is not being used, then buy or build one of those "tuner emulators" which tricks the 706 into thinking an AH-4 is connected and enables the "Tune" button on the front of the rig.

Then you can just press "Tune," it will put the rig into CW mode and it will TX a roughly 10-watt signal for several seconds (duration determined by value of capacitor used in the device).

DIY example: http://www.prnewell.com/kc2wi/Icom_tune_control/

Another DIY example: (published by SGC for use with its tuners, which I have built):
http://www.sgcworld.com/Publications/Downloads/ic706connecting.pdf

There is a "manual" version as well, designed by Phil Salas, which does not use the "Tune" button, but a separate momentary push-button switch:
http://www.ad5x.com/images/Articles/TuningIntfc706.pdf

Also DIY for 706s and screwdriver antennas: http://www.w5dxp.com/706screw.htm
There are commercial versions:

One example: http://vk1od.net/module/TuneMate/

Another example is at http://www.w4rt.com/ under "ICOM Accessories" (full control for motorized antennas) and
finally, the "TurboTuner" automatic tuning interface: http://www.n2vz.com/

There are some items that will not be saved or be able to be uploaded to the 706.  Icom did not pass all the commands through the serial port.

After you save/load the 706 you will still need to go to each memory and make sure the tones and off sets and such are what you want .

This is not a softwear problem, but an Icom 706 problem.
It does not mater what softwear you use.

I got tired of using AM. Seems my radio was always in FM so had to change to AM and I'm not sure a 40w AM carrier is any better than 100w cw or rtty.

I started using rtty and reducing power, I just seemed to like it better and seem like less steps. I've got a couple of those tune modules but I grew tired of them also. The push button one Of Phil's that Larry linked to sounds interesting.

From: Al Waschka
Topic: 20733  Message: 20770

Correct. YPlog does splits in the same manner as quick split in the 706 menu. You can load offsets with YPlog; I have verified that. But you cannot load different tones into different memories with YPlog. If you load an offset, YPlog loads the tone that is set in the 706 menu. So set that tone to whatever tone you use the most. You will then have to go in and change the tone in the memories for repeaters that use different tones.

Regardless, it is still substantially more convenient that loading memories by tuning the VFO to each repeater and loading the memory. You would still have to change the tone for each repeater using a different tone.

Well, almost any of the tuner emulators can be linked to the screwdriver tune voltage. The relay version is particularly simple. Just connect the relay coil across the motor line. Whenever there is voltage on that line, the radio will go into tune mode. My ultimate plan is to do that, but have another switch in series so that if that one is open I can tune on receiver noise.

Don't go tuning your screwdriver antenna with the 706
at full output. You will fry the filter board and possibly the finals.
I respectfully suggest using an antenna anaylizer to mark settings.

This is too good to be true! You can really load memory info into the MKII from a PC? Even alpha characters for memory names? I have to have this, even with some exceptions.

Correct. YPlog does splits in the same manner as quick split in the 706 menu. You can load offsets with YPlog; I have verified that. But you cannot load different tones into different memories with YPlog. If you load an offset, YPlog loads the tone that is set in the 706 menu. So set that tone to whatever tone you use the most. You will then have to go in and change the tone in the memories for repeaters that use different tones.

Regardless, it is still substantially more convenient that loading memories by tuning the VFO to each repeater and loading the memory. You would still have to change the tone for each repeater using a different tone.

There are some items that will not be saved or be able to be uploaded to the 706. Icom did not pass all the commands through the serial port.

After you save/load the 706 you will still need to go to each memory and make sure the tones and off sets and such are what you want .

This is not a softwear problem, but an Icom 706 problem.
It does not mater what softwear you use.

Hello All,
Re: Al's e-mail below, I looked online and noticed that programming cables for the IC-706 are readily available at a reasonable price.
However, it looks like the YPlog Program costs quite a bit unless you download the Spamware version? I am just interested in programming the radio without
the control and logging functions. Does anyone know of a software program that is free or inexpensive that will program the IC-706?

Thanks,
Kevin

Subject: [ic706] Programing IC-706 Memories from a PC

I stumbled across this on the CHIRP reflector, where someone was asking about programming the 706 memories. I think I have seem similar questions here. I was interested because I put a lot of time into programming my 706 mobile rig from the front panel and was looking for an easier way to duplicate the loads in my 706MkII which is replacing the 706.

The logging program YPlog has the capability to read and write memories in the 706 family of radios (among others). There are a few subtleties I have deduced from my limited experiments.

1. The memory data table is not editable by common techniques such as COPY, CUT, and PASTE. You may only enter and delete data in single fields.
2. You can program memories as splits for repeaters by loading a TX OFFSET, however, contrary to the HELP file's claim, entering 600k will not set the split to 600 kHz. One must use 0.6 (as in MHz).
3. YPlog can WRITE offsets to the radio but does not READ offsets from the radio.
4. Memories P1 and P2 in the radio are 100 and 101 in YPlog and the calling channel is 102.
5. The radio indicates that a tone is loaded into all memories where FM mode is programmed. I'm guessing that they are all loaded with the tone that is set in the radio's menu.

I used a Timewave HamLinkUSB cable, with the appropriate driver, of course.

Hope this is useful news. It was for me.

No, not alpha characters.

As noted in my original post, YPlog will read receive frequency and offset from the radio, and it will write receive frequency, offset, and if offset is non-zero, the tone set in the 706 menu to the radio. Nothing more.

But it is still better than loading each frequency from the front panel.

The DIY tune module versions with a capacitor can be tweaked for duration of the CW tone emitted by changing the value of the capacitor.

Somewhere, I have the instructions for doing that.

Kurt, my 706 is not my main rig anymore and hasn't been for 2 1/2 years since getting the k3. I really liked my pal star manual tuner and still do but I also have a ldg auto tuner that plugged into the ah4 socket. I'm pretty sure it used the 10w tune and may have tuned via the tune button on the 706, I could check. This would be the way to go with a atu, one that syncs with the 706. Of course it's all what you get used to or want to do.

Additional info for my 706 for sale.

I forgot to include that I have never had this mobile, but I do have the OPC-581 separation cable, MB-62 mobile mounting bracket and MB-63 mounting bracket, and original power cable, HM-103 mike, original manual. All included for $450.00 plus shipping. PayPal preferred, USPS postal money order, no personal checks please.

That's a pretty good price. I sure wouldn't turn loose of mine for that much. It sits on the shelf just looking "purdy". I really should get rid of it and the 7K, but I want to hang onto something small for mobile, should the need arise.

# 20786. Size of Alignment Tool for IC-706 Variable Inductors

Yahoo group: ic706 (2010 — 2015)
Date: 2013-09-20 20:44:11 UTC
From: <kawill70@...>
Topic: 20786  Message: 20786

Does anyone know what kind of tool is required to adjust the variable inductors in the IC-706MKIIG? If it is a hex shaped tool I would be interested in the dimensions.
I need to adjust L601 for the PLL frequency adjustment and wonder if a steel allen wrench of the correct size could be used if a non-metallic tool is not available. With a steel tool I assume you would need to remove the tool before checking the results.

Is it possible you pressed the "LOCK" button located at the lower left of the main tuning knob? A quick push cycles it on/off. There is an indicator LED to the left of the button that indicates when locked. The same button also activates the optional voice synthesizer if pressed for about 2 seconds.

An allen wrench is not going to do you any good as it will throw the inductance way off while it is in the coil. I think Radio Shack sells a package of alignment tools, or you can Google for "diddle sticks" or "Alignment tools" (although the latter will get you a lot of irrelevant hits). Mouser and Digi-key would also be a good place to search.

You can also whittle the end of of a hardwood dowel to fit the slug.

Regards,
Ed

The allen wrench will throw the adjustment off.

 It will also give you a good chance of breaking the tuning slug.  They are very brittle.

Gentlemen,

For sale original IC-706 to include Remote Head Extension cable and heavy duty fused 12 volt power cable and bound paper manual. Precisely calibrated and there are no technical issues that I'm aware of. Out-of-band transmit enabled for 1.6 MHz to 54 MHz.

Optional power supply IC-PS20 12 volt 20 amp with speaker and fan - for pickup only. No microphone.

IC-706 - $450 plus shipping (pick up or ship)
IC-PS20 - $40 (for local pickup only)

Here's a YouTube movie of a QSQ I made a couple of days ago.
http://youtu.be/BoBT4rfG2A4

Image here:

# 20798. Icom 706 accessories for sale

Yahoo group: ic706 (2010 — 2015)
Date: 2013-09-27 02:49:11 UTC
From: John Geiger
Topic: 20798  Message: 20798

I have for sale the following accessories for the Icom 706 series of radios. I can take paypal/check/MO, and prices include shipping in the US. Here is what I have available:

1. Better RF tuning control-plugs into the tuner jack on the back of the radio, and sends out a 10 watt carrier when you push the tune button on the radio. Perfect for using with a manual or autotuner. Sells new for $32 plus shipping, I am asking $23.

2. Separation kit, including the bracket for the faceplate, and the separation cable. Asking $40

3. Keypad that allows direct frequency entry, switching between VFOs, and split operation. It runs on a 9 volt battery. It is a homebrew job, but looks very nice. The keypad plugs into the CI-V port on the 706 and uses a programmed 16F84 PIC micro-controller. It allows for direct frequency entry, and gives you the SPLIT and A/B commands, plus several other programmable features. There have been numerous upgrades to this little box, and in fact it is now available in kit form for $55. G4FEV re-housed the PC board inside the numeric keypad from an old computer keyboard! You can read all about it in these two bitmap image files:

http://g4fev.atspace.com/706_pad1.bmp

http://g4fev.atspace.com/706_pad2.bmp

I am asking $23 for it.

From: John Geiger
Topic: 20802  Message: 20802

I have for sale the original model of the Icom 706. This is the model that does 100 watts on HF and 6m, and 10 watts on 2m. It is in very good shape, and works great. One of the best looking 706 originals I have seen. It comes with the original box (which is also in excellent condition), manual, mic, and long power cord.

It works fine and has done a good job in the CQWW RTTY contest this weekend. Even worked a new RTTY country on it!

I am asking $400 plus any shipping if necessary.

Hello all.

I have a Heil Traveler Boomset (& IC-706 adapter) which I purchased brand new in early 2007 when they phased out this design. This boomset and the IC-706 adapter have never been used. I recently found this in storage and decided I really don't need it. I'm offering it for sale to this list first before posting it somewhere else so you guys get first dibs!

I would like $75 for the boomset and adapter + shipping to your zip code. US buyers only please. Sorry DX!

Please contact me off list if interested.

Hi Al,
I downloaded the YPlog program and it works very well for programming the IC-706.
I used an inexpensive USB Cable from China - no complaints so far.
I like the fact that YPlog saves many steps entering info into the Memory locations.
Thank you for the info.

Subject: RE: [ic706] Programing IC-706 Memories from a PC

No, not alpha characters.

As noted in my original post, YPlog will read receive
frequency and offset from the radio, and it will write receive frequency,
offset, and if offset is non-zero, the tone set in the 706 menu to the
radio.  Nothing more.

But it is still better than loading each frequency from the
front panel.

Al

This
is too good to be true!  You can really load memory info into the MKII from
a PC?  Even alpha characters for memory names?  I have to have this,
even with some exceptions.

Subject:
RE: [ic706] Programing IC-706 Memories from a PC

Correct.  YPlog does splits in the same manner as quick
split in the 706 menu.  You can load offsets with YPlog; I have verified
that.  But you cannot load different tones into different memories with
YPlog.  If you load an offset, YPlog loads the tone that is set in the 706
menu.  So set that tone to whatever tone you use the most.  You will
then have to go in and change the tone in the memories for repeaters that use
different tones.

Regardless, it is still substantially more convenient that
loading memories by tuning the VFO to each repeater and loading the
memory.  You would still have to change the tone for each repeater using a
different tone.

Subject: Re: [ic706] Programing IC-706 Memories from a PC

There are some items that will not be saved or be able to be uploaded
to the 706.  Icom did not pass all the commands through the serial port.

After
you save/load the 706 you will still need to go to each memory and make sure the
tones and off sets and such are what you want .

This

is not a softwear problem, but an Icom 706 problem.
It
does not mater what softwear you use.

Great Kevin,

Glad it worked out for you .. It is WAY better than going back and forth between VFO and memory screens and dialing up each frequency.

Al

Hi Al,
I downloaded the YPlog program and it works very well for programming the IC-706.
I used an inexpensive USB Cable from China - no complaints so far.
I like the fact that YPlog saves many steps entering info into the Memory locations.
Thank you for the info.

No, not alpha characters.

As noted in my original post, YPlog will read receive
frequency and offset from the radio, and it will write receive frequency,
offset, and if offset is non-zero, the tone set in the 706 menu to the
radio.  Nothing more.

But it is still better than loading each frequency from the
front panel.

This
is too good to be true!  You can really load memory info into the MKII from
a PC?  Even alpha characters for memory names?  I have to have this,

even with some exceptions.

Subject:
RE: [ic706] Programing IC-706 Memories from a PC

Correct.  YPlog does splits in the same manner as quick
split in the 706 menu.  You can load offsets with YPlog; I have verified
that.  But you cannot load different tones into different memories with
YPlog.  If you load an offset, YPlog loads the tone that is set in the 706
menu.  So set that tone to whatever tone you use the most.  You will
then have to go in and change the tone in the memories for repeaters that use
different tones.

Regardless, it is still substantially more convenient that
loading memories by tuning the VFO to each repeater and loading the
memory.  You would still have to change the tone for each repeater using a
different tone.

# 20807. The MDSR Team releases IF-DSP software MDSR V2.7

Yahoo group: ic706 (2010 — 2015)
Date: 2013-10-08 16:13:14 UTC
From: <alexschwarz237@...>
Topic: 20807  Message: 20807

Hi Everybody;

The MDSR Team has just launched the next edition of the popular MDSR IF-DSP software V2.7.

Please see the software manual at:
http://www3.telus.net/public/bc237/MDSR/Software%20Manual%20MDSR-J.pdf
http://www3.telus.net/public/bc237/MDSR/Software%20Manual%20MDSR-J.pdf

There are two version of the MDSR setup program. There is a light version which includes the basic setup with MDSR-SA, OmniRig and an updated MDSR.jar application. If you already run the MDSR V2.6 with all the additional applications like fldigi, VLAN and Dream use this version to upgrade your MDSR application to V2.7.

http://www3.telus.net/public/bc237/MDSR/MDSR-Win32-Setup.exe
http://www3.telus.net/public/bc237/MDSR/MDSR-Win32-Setup.exe

If you have not MDSR on your computer please download the full version 2.7.

http://www3.telus.net/public/bc237/MDSR/MDSR-Win32-Setup-Full.exe
http://www3.telus.net/public/bc237/MDSR/MDSR-Win32-Setup-Full.exe

Note: Please back up your current configuration with the profile manager accessible from the MDSR-SA by clicking on the “Disk” icon (left bottom) before updating. The upgrading process has been tested and does not interfere with your current setup, but it is better to play it save.

What’s New?
· Integrated level meters to tune the MDSR
· Upgraded IF ACG system for even cleaner sound
· VOX control for PTT operation
· BFO tuning function
· Bug fixes and a newly updated MDSR manual included in the setup.

For more and detailed instruction please refer the MDSR and MDSR-SA user manuals.

All the best and 73;

The MDSR Team
http://users.skynet.be/myspace/mdsr

If you are using Firefox and detest the new Neo look to Yahoogroups web interface there's a plugin
available that reverts everything back to the old style, no idea how it works but it does! I'm using
it here, no alarms bells sounded when I installed it, can't see anything dodgy about it and all
reviews are good. http://ehibbert.org.uk/extension/install.html

# 20811. Icom 706MKIIG and filter issue?

Yahoo group: ic706 (2010 — 2015)
Date: 2013-10-15 18:35:36 UTC
From: John Geiger
Topic: 20811  Message: 20811

I have an Icom 706MKIIG I picked up recently, and I installed the FL101 250hz CW filter in it. It seems to have more filter blowby than the 706 original and 706MKII models I have used in the past. I can hear loud stations several KCs away with the filter in line. Is this common for the MKIIG series? Also, the FL101 seems to knock down the receive levels more than I remember it doing in the 706MKII I had recently (also with a FL101 installed). On some bands it seems that I have to really crank up the audio to hear some things (and this is with headphones). I know the filter is working somewhat, at least, because I am receiving things with it in line.

What's the antenna?  Could it be you're picking intermod products?  Does it do this with a different filter?

It's not so much an antenna issue but a "feature" of the 706 of being easily overloaded.

A quick test would be to enable the attenuator and see if the symptoms change.  I know blowby is different than IMD but it's a quick and easy test to see if that's what you're hearing.

I had both a Mk2 and Mk2G. Using the same filter in each rig I noticed the same thing. Signals would get round the filter in the 2G, but not when the same filter was placed in the Mk2. Guess they may have changed the board layout or filter matching in the later set.

You can get an Icom cable for around $ 100.  I would look on ebay and get a cable there. Depending on your computer needing a usb or rs232 cable.

Here is one example of the ebay number for the usb:
310761306494
another one from China that cost less;
280651631055

Here is an example for the rs232 :
310773317663

Just search for Icom ci-v cable and take your choice.  They run from about $ 10 up.
Many of the Icoms use the same cable.

I am looking for an Icom FL-100 500hz CW filter to go in an Icom 706MKIIG I recently picked up. I tried the FL101 250hz filter in it and just don't like the way it sounds with that narrow of a filter, so would like to go back to the 500hz one (just sold one recently). Let me know if you have one for sale,and we can work out the details
.

Avoid any cable that uses a prolific chipset or chinese knockoff.  Use one that uses a FTDI chipset.

I purchased the following from Amazon, it installed and works perfectly under WIN 7 PRO (64 bit) with an "original" IC-706 running HRD/DM-780 and other soundcard digital modes and programs:

http://www.amazon.com/Interface-IC-7000-Chipset-Supports-Windows/dp/B004L0T4UM#productDetails

FTDI chipset.

What's "FTDI," and how do I tell if a cable is "FTDI" or not?

FTDI is "chipset" brand name and the specs for the device will (or should)
tell what what chipset is used in a Serial-to-USB converter, or in a
CI-V-to-USB control cable for ICOM rigs.

I use the one from g4zlp:http://www.g4zlp.co.uk/unified/IcomCAT.shtml
Scroll down to the FTDI Dongle, its about $12US. You have to buy each cable for different radios for about $14US, but the dongle works with all the cables which works with just about any radio ever made with a computer interface. I use the same dongle with my IC-706 and my FT-890at (made ~1990).

That and I would rather support a HAM than some random company from china.

FTDI is a UK company, not some "random company in China."

Valley Enterprises, from whence I bought the CI-V-to-USB cable with the FTDI chipset that I posted to this list recently, is an Idaho-based Company.

# 20830. Remote 706 display in mobile

Yahoo group: ic706 (2010 — 2015)
Date: 2013-10-31 14:38:12 UTC
From: Ron Lawrence
Topic: 20830  Message: 20830

Does anyone know if there's ever been a remote display
for the ic706?
I'm really enjoying using my 706 in the mobile but it's
dangerous to look at the display, the ham radio version
od "texting" I guess.
I have the radio mounted on the hump right in front of the
seat where I can easily just lay my hand on and tune, but
if I need to look at the display it dangerous.
If I had a remote display I could mount on top of the dash
it would be much easier just to glance at the freq display.

A heads up display would be GREAT.

I'm loving HF mobile using the 706, I get great signal reports
on it just using the barefoot 706 and a used Pozy Screwdriver.
After I found the problem in the screwdriver installation with
the help of a couple friends KT4TF and N4ILK, the screwdriver
now works great.
Except for having a hard time busting through a DX pileup, if
I can hear someone I can usually work them. My best contact
so far is a VK4 in Australia, not bad for a 100 watt mobile
and this was before I found the problem with the antenna and
my SWR was about 2:1...

If you hear W4RON give me a call.

Hi Ron,

You could use the separation kit to mount the faceplate right in front of you.

I take it, then, you've never detached the control head from the main body of the 706?

Facing the unit, there's a latch on the left side of the control head that allows the control head to detach from the main body.

Plug the "optional" (OPC-581, shown in back of 706 manual) separation cable into the back of the control head, and you can put the control head/display up to 11.5 feet away from the main body.

I have the main body of my IC-706MKII mounted in the back of my CR-V with a tuner and near the feed point of the antenna mount on the rear door, with the control head on the console on a LIDO mount next to me.

Yeah I'm not stupid, I know how to detach the control head, but that
doesn't help my problem, I like where the tuning knob is when the
radio with it's control head attached and mounted on the console
right in front of the seat. What I would like to have is a remote
display to mount on the dash so I don't have to look down at it
to tell what freq I'm on. Having the knob up on the dash would be
a real pain.
Just a remote display is all I'm looking for. I lots of people
made freq displays for early analog rigs like the TS-520 and the
FT-101Es.

# 20835. Re: [ic706] Remote 706 display in mobile

Yahoo group: ic706 (2010 — 2015)
Date: 2013-10-31 16:32:57 UTC
From: LARRY J. FORD
Topic: 20830  Message: 20835

Well, of course, you're "not stupid," as your website proclaims your membership in MENSA!

However, I wasn't the only one who responded in accordance with the Subject Line "Remote 706 display in mobile" with reference to detaching the control head.

Now that we know what you are actually talking about, there was a third-party external "display-only" for the IC-7000, marketed on various ham sites, e-Bay, etc., which, as I recall, had a stand-alone, 7-inch LCD display that replicated the display on the IC-7000 itself.

However, the IC-7000 has, I believe, a digital video output port of some sort that digital LCD display plugged into, and the IC-7000 was apparently designed to accommodate an external display.

In all my years of 706 ownership, I've never seen any similar device for the 706. The closest to what you want that I've seen is something like Ham Radio Deluxe which, when running on a PC connected to the 706 via the CI-V port (which is a serial port, I believe), will display certain limited parameters such as frequency and a few other items.

That might provide a starting point for the MENSA crowd to "whip-up" a solution.

> Does anyone know if there's ever been a remote display
> for the ic706?

There's no direct interface for the display, but the frequency and a lot of the indicators on the display can be queried through the CIV port.  Seems a straightforward approach would be to have a PIC or similar processor send the appropriate CIV commands and write the result to an off the shelf serial LCD.  Might have a bit of latency but most info is fairly static.

Another option is a small tablet or laptop PC running any one of the available rig control programs.

I've run a fair amount of mobile operating with the 706 and agree that the display could be larger.  I work around it by creating logical groups of memories that set a center frequency, mode, etc and rarely need to access any of the menus.

If I remember correctly, a number of years ago in CQ magazine, the was a sort blurb and photo of a ham who wired his Icom right into the car display on the center console. Quite amazing. You will have to search CQ, and maybe contact the ham involved, for ideas. Only will work if your car already has a built in display.....

From: Jason Blakley
Topic: 20830  Message: 20839

I would look into building an Arduino controlled LED display to read the frequency right off of the CI-V bus. I am working on an Arduino project and I found several beautiful multisegment LED displays on amazon and eBay for cheap.

I don't have the ham radio Arduino project book that just came out, but you may want to look into it. There may already be a project out there that someone has already coded up.

Just my 2¢

Yep, that sounds like a good, conceptual start right there.

Now that I think more about it, but don't have time to research it, the IC-7000 may have had an analog video "Out" port for that stand-alone, third-party digital display.

Either that, or the display unit was able to convert digital signals from the IC-7000.

Very well could have been an IC-7000.
So long ago I do not recall, only that it was an Icom for mobile .
very cool though!!

# 20842. No audio when transmitting on vhf/uhf

Yahoo group: ic706 (2010 — 2015)
Date: 2013-11-01 04:32:53 UTC
From: ko6r
Topic: 20842  Message: 20842

Variation on an old theme: Now my IC706MkIIG is suddenly dropping the audio on transmit after about a tenth of a second. I've listened to it on another radio, and it's behaving the way my friends have told me it was during a sked.
Only happens on fm on vhf/uhf. On hf, or on vhf/uhf ssb, no problem.
I've tried switching the mike from back to front -- no difference.
No other problems with the radio.

Any ideas gratefully received.

Peter KO6R

"That might provide a starting point for the MENSA crowd to "whip-up" a solution."

How about an unobtrusive pinhole camera and a composite LCD monitor as a pseudo heads-up display? Shouldn't be more than a few bucks off ebay.

You know, as cheap and ubiquitous as some of that hardware is, you have a valid point.

How 'bout a wifi webcam streaming to a cheap tablet, or better yet a set of Google glasses?

Well I have no idea what the requirements are now, but when
I was tested in a proctored test session in 1984 I had to take 3
different IQ tests. I think you had to score above the 98 percentile
on at least 2 of the tests. The average minimum IQ is about 130.

But it's all academic now as I've let my membership lapse last year.
The membership fee was $45 a year and since I retired I didn't
think there was any need for it.
I know for a fact it looks real good on a resume, it's funny that
most people I interviewed with didn't know what MENSA was until
they looked it up.

# 20848. Icom CW filters for sale

Yahoo group: ic706 (2010 — 2015)
Date: 2013-11-07 02:43:27 UTC
From: John Geiger
Topic: 20848  Message: 20848

I have for sale a couple of Icom CW filter. Each one is $75 shipped. These work in most Icom rigs, but not in the 703/718/707, as they take the 455khz IF filters instead. I have a FL100 500hz CW filter, and the FL101 250h CW filter. I can take paypal/check/MO.

# 20853. Re: No audio when transmitting on vhf/uhf

Yahoo group: ic706 (2010 — 2015)
Date: 2013-11-01 19:26:36 UTC
From: ko6r
Topic: 20842  Message: 20853

Update: Just found out, by listening on another radio, that if I hold down the PTT button for a 1-2 count, the audio kicks in.
Tried it with a pal on our local repeater, keyed and then counted to 5. He told me heard me say "3".
So, at least the radio is working on FM on 144mHz.
Anyone ever have that same phenomenon, that there's a momentary audio burst, then a dropout, then a return of audio?

Thanks for any input.

You'll probably find that it does it on SSB also. This radio seems to have a problem with DC on the audio line that temporarily biases things up and cuts off the audio when first keyed and then tapers back to normal. This causes a DC "pulse sounding noise" (thump) in the transmitted audio and a slow (2-3 second) recovery of the audio when first keyed. I have one mic that does it, but my Heil does not. The stock hand mic doesn't have the problem either. I haven't bothered looking for a fix, since I rarely use the rig and can live with it the way it is as a backup.

Thanks, Ralph. However, my problem is not a lack of carrier. Radio transmits fine. It's the audio that requires warming up before it's consistent and immediate.

Hi Everybody;

I would also suggest that people at least read the following Yahoo Group to see how we are pursuing getting things changed; I personally would like to see an option for people to have a choice of interfaces, but a rollback of the new interface would be a nice start and having Yahoo do real beta testing on this would be good.

# 20859. Icom 706MKIIG for sale

Yahoo group: ic706 (2010 — 2015)
Date: 2013-11-10 19:37:55 UTC
From: John Geiger
Topic: 20859  Message: 20859

I have an Icom 706MKIIG HF/6m/2m/70cm transceiver for sale. This is the model with DSP as standard, back lit keys, and does 100 watts on HF and 6m, 50 watts on 2m, and 20 watts on 70cm. The case on the MKIIG shows some wear from mobile use. It doesnt look too bad but does have some scratches on the sides of it from the mobile bracket. There are also a couple of light scuffs on the top of it. The face looks pretty good, with a light scratch on the display, but it doesn't interfere with seeing anything.

This is a great way to get on HF as well as 6m, 2m and 70cm SSB/CW-the main VHF contesting bands. It comes with the microphone, power cord, and original box. I am asking $550 plus shipping. You can pick these up in Lawton, OK and save shipping charges also.

From: <alexschwarz237@...>
Topic: 20852  Message: 20860

HI Everybody;

I have found a way to block the annoying ads on the Yahoo site altogether, but it only works if you use Firefox. I recommend that everybody upgrades to Firefox anyways. There is an add on called Adblock Plus that can be installed onto Firefox and all the ads will not be downloaded to your computer. This is great, because all the adverts take up bandwidth.

If you already use Firefox here is the link to Adblock Plus:https://addons.mozilla.org/en-US/firefox/addon/adblock-plus/
https://addons.mozilla.org/en-US/firefox/addon/adblock-plus/
https://addons.mozilla.org/en-US/firefox/addon/adblock-plus/
Never be bothered by inappropriate and annoying ads that waste your internet speed and can become costly if you are past your data limit.

Does it occur on more than one repeater?
Observe it on ssb even 2m ssb paying attention to power out and alc meter function.

I had that happen once on a Kenwood. It had to do with the switch timing (bent contacts) in the microphone DC switch for the battery in the mic. Otherwise, can't help with why it would 'suddenly' happen.

Yep. ALC pulse (without audio) at the instant of keying will indicate
the problem I spoke of.

Thanks, Gary -- doesn't happen on SSB, only on FM.

I would try to be sure it's the radio maybe via fm simplex.

Someone, perhaps Gary had a similar issue a while back.

# 20870. Reasons to prefer 706MKii or G-models?

Yahoo group: ic706 (2010 — 2015)
Date: 2013-11-24 16:28:33 UTC
From: qrv@kd4e.com
Topic: 20870  Message: 20870

I'm looking at prices and models of 706's and need some
current-day informed input, please?

I'm reading that the finals in some earlier models may
be unobtanium, in some models they may be replaced by subs,
that a variety of failures show up over time in early
models, and that some features have been added or improved.

What I mostly need is the following:

A mobile rig with separation kit.
HF SSB (& maybe digital).
10M FM
Reliability

Helpful:

Good automotive noise blanker.
Good band noise filter.

All the rest of the modes and bands are gravy.

QUESTIONS:

Does the DSP work well?

Since I don't think I need the extra G-series features
is there any good reason not to go with a 706MKii?

What gotcha indicators of a problem rig should I look for?

Thanks!

I have an ICOM IC-706MKII which I use primarily for mobile operations.

Based on what you have posted, and if you are not interested in 440 band or higher 2-meter power, one thing you may want to consider is the fact that the IC-706MKIIG has a 6-pin DIN DATA port on the back, which may come in handy for certain digital modes, which you mentioned. Otherwise, you'll be using the 13-pin DIN ACCESSORY Port on the back of the 706MKII with an interface like a Signalink (which I use) for digital modes.

Also, one thing to keep in mind is that the "DSP" in the 706 models (standard in the MKIIG, an "optional add-on" for the MKII series, and not available at all for the "original" 706) is Audio Frequency based DSP, not IF DSP, as found in the 7xxx series of ICOM rigs.

Although the AF DSP is not half-bad (I have it on my 706MKII) and better than nothing, it pales in comparison to the IF-level DSP in my IC-7200.

I paid $500.00 3 years ago for my used MKII, with a MARS Mod and mobile accessories. The case had a few scratches as well as a scratch on the screen of the control head, but not anything that affects the performance.

Hi _ I have the 706MK2g, The DSP unit is a waste, The noise blanker was designed for AM mode only according to what they said, does not do anything... What does work well is the sensitivity on all bands, plus alot of other good features. I have the 250 KHZ CW filter, use the band pass along with the CW filter and it is really an excellent CW filter. Unless I did some thing wrong when I programmed the memories. If you go into a memory and turn the main tuning knob, the memory channel frequency will tune off the freq programmed and your setting such as plls, etc will be lost. Then you go out the memory setting back to VFO-A and then back to memory setting and all will return. Turning on the lock function you can still go memory to memory and if you turn the main tuning dial, the memory setting will not be lost.... Also what is good about the radio, it does cut down the power if you accidently bypass the antenna tuner, so you do not hurt the power output
finals.. On My radio you can make it work in conjuction with IC-735. I do not know about the differences with the IC-706 radio, mine does have 440 MHZ. There are other good features about the MK2G including split function.  They have a multi pin jack in the back for hooking up RTTY, etc along with the the plug and all  the multi colored wires attached to it.. These wires are 3 inches long, they should have been longer as to work with them easier... Just checked,it does FM capability on 10 meters for repeater work and it works fine... I read you are doing your homework on this to buy the proper radio..., good luck with your descision==73-Steve--WB2OEE

Thanks Larry!

That's most of what I needed to know.

I have an IC-7200 as my main fixed rig and like it more every
day - especially as Hams post suggested settings on the 7200 list.

OK re. AF vs IF DSP. The IF DSP in the 7200 is amazing.

The different digital mode connector sounds promising - not
needing that extra accessory interface is a hassle-reduction worth
considering.

Is the 6-pin DIN DATA port interfaced directly to a PC via
a DB-9 connector or a serial-USB adapter?

Thanks again!

David

# 20874. IC706 CAT baud rate

Yahoo group: ic706 (2010 — 2015)
Date: 2013-11-24 18:58:53 UTC
From: <f6gnz@...>
Topic: 20874  Message: 20874

All published data show 1200 bps as default CAT CI-V baud rate for IC706.
But, using the MicroHAM Keyer and the associated Router s/w, I found that it perfectly works at 9600bps (706 won't even respond if 1200 bps is selected in the Routers Test window ). However, with Router set at 9600bps and an associated logging program, like DX4WIN is set to 1200bps all works OK, but it also works OK with 9600bps set in the logging program ! So, what is the reason of specifying 1200 bps for IC706 CAT??

I have an original 706 and the final transistors are rare. When I bought my radio it had very little output on hf and six but it was a 2 dollar diode on the swr metering circuit that had failed and it thought it had high swr.. an easy fix but you just never know.
I cannot fault the radio.  If its treated well like not operated into a high swr, attention payed to duty cycle so it doesnt overheat and disconnected when there is a possibility of lightning discharge there is no reason to shy away from an early model in that regard.
Mine has had the wideband  VHF mod done and at some point I am going to reverse it because its terrible for overload running mobile. It may be ok where you live but there is a lot of commercial activity in my neck of the woods.

On my original IC-706 I believe the default of was auto for C-IV (CAT). That was not reliable in detecting the baud rate so I set it to 19200.
I have been using it that way for years. It works great with DX Labs suite, Commander app.
On mine you set it by holding lock while turning on the radio. It's menu item 22 C-IV baud.

Not sure but I think the original 706 has 1 less filter slot.

The NB works on spark plugs for me.

The DSP takes the edge off and that's it. It does I believe have some cw features.

Unless the price is right, I'd insist on newer Mittsubishi finals.

Accessories are starting to fetch premium prices.

I had 3 and now 2 so I like them but the newer I.F. Filtering and dsp on newer rigs is worth the gingle.

Hi Tom,
Thanks for the answer. I have not looked into user manual as even my logging program DX4WIN shows 1200 bps as default rate. After getting into manual, I realized that settings was auto as default and that there was a possibilitry to select fixed rate, so I selected 19200 as fixed rate and it works perfectly with mo logger, Omnirig and RigSync, synchronizing IC706 with my SDR RX.

Hi,

I'm using a signalink interface using the accessory port on my mkii.

For cat control I'm using one of those cables commonly found on Ebay but with the ftdi chipset (prolific yuck!)

The problem is it raises my noise level atleast an extra 3 s points.
When unplugged the noise goes to 0.

Anyone have any suggestions please?

Topic: 20881  Message: 20883

I use a CI-V to USB cable with an FTDI chipset to connect the CI-V port on my 706 to a PC for CAT control with HRD/DM-780, et al. (see http://www.amazon.com/Interface-IC-7000-Chipset-Supports-Windows/dp/B004L0T4UM )

No problems whatsoever, works like a charm.

If you could try another cable, and the problem goes away, then you've found your issue.

The cable may have inadequate shielding and is allowing random EMI in the shack to get in the cable.

You could try putting a few turns through a toroid core on each end, or a couple of the "snap-on" ferrites as chokes.

What happens when you unplug the antenna?

Just as culpable as a radiating USB cable can be, the lack of shielding/isolation of the antenna feed can be just as much a contributor.  If effectively your antenna is right next to the data cable, even a tiny amount of EMI will cause interference.

If adding ferrites to the USB cable helps, then great.  I would also look at improving the isolation of your antenna feed too.

I have a plain jane 706, no MKII or G. I have full power out of my PA on cw fm and am. I can ONLY get full power out on SSB by shouting into the mic!

Yes I have adjusted the mic gain via the menu

I have spoken to two others here in town that have observed this with their 706's also, one a plain 706 like mine and one a MKIIG

Have any of you observed this?

Anyone using a aftermarket mic with success? Which one?

Oh.,, power is measured with a bird 43 with a peak reading kit in it

I have an "original" IC-706, used as "back-up" HF rig in the shack, and an IC-706MKII, which I run mobile. Both are used with the factory-standard, unmodified HM-103.

No issues as you report.

HOWEVER, how are you measuring that "full power out?" SSB is a PEP mode, and the peak output can ONLY be measured by a true, active, peak-reading wattmeter like the Ameritron AWM-30.

Wattmeters in, for example, the MJF tuners are usually "average" reading wattmeters (e.g., a 100-watt PEP transmission might register only 10, 15, or 20 watts on a "average reading" meter), and those that claim to be "peak-reading" are notoriously inaccurate.

Hey Ronnie!
The original 706 has notoriously low Mic gain. What I did was set it for good audio on FM (mic gain at 8 or 9 I think), then switch to SSB and turn on the compressor. Adjust the compressor gain pot on the side of the rig for a little ALC and it should be good to go. Just don't forget to turn it off when switching modes. The softkey for the compressor goes away unless you're in SSB making it a bit of a PITA to turn off after -- and if you forget, someone will probably remind you... LOL

I used to have a Bird 47 with Peak reading kit. I didn't check it
against a known source, but I never had the feeling it was all that
great at catching those peaks. YMMV

I have never noticed this problem on the 706 original or the MKIIG. Did notice it a little on a MKII I once had, but it is not an issue with the MKII I currently have. Make sure you turn the compression on, and increase its level a little if necessary.

FWIW I had almost no audio out with my MKIIG and finally figured out that both mic jacks (face plate and rear panel) are always 'hot'.

If you have two mics plugged in neither will give you much.

Just a thought, good luck.

It is possible that Icom did this on purpose so that in a mobile situation, the mic is less likely to pick up road noise or wind noise, but it requires the user to close-talk the mic and to talk loudly. If you take the mic apart, you will see that there is a fairly long path from the grill openings the the mic element. Following recommendations on the web, I drilled a very small hole through the front of the mic and centered on the mic element. It seemed to help with my original 706.

I tested my "original" IC-706 in the shack with the stock, HM-103 mic over the past couple of days, and using an Ameritron AWM-30 active, peak-reading wattmeter, and see full output power on SSB on peaks using normal voice, not shouting but not "whispering," either.

However, the wattmeter in the MFJ tuner, which I believe is only an "average" reading wattmeter shows considerably lower readings.

Mic gain is set at "5" and NO compression is being used.

When mobile, I run a an IC-706MKII and the stock, HM-103 mic, I use compression, see full power output, and usually get reports of a "good mobile signal."

I also occasionally use a Heil "Traveler" headset with a Heil electret mic element with the original 706 in the shack, and it works quite well. Heil publishes recommended settings for the 706 (and other ICOM rigs) when using the Heil Traveler.

Perhaps the operator who experienced the issues with the stock mic might try one or more of the mods published for the HM-103 to resolve his issues.

Many thanks for the feedback.

A good few things to consider.

The cable I got is exactly the Same one that is in the link from amazon.

One idea which mark picked up on was about unplugging the antenna.

Well I did that and it all went away.

I do have local noise anyway. It's probably a plasma or dodgy psu at a neighbours.
But this noise from the cat cable is another 'layer' on top again, That is to say I can audibly hear when the cable is plugged in.

I've tried 6 snap ons with no difference.

Just for the info I use 450 ohm ladder line going straight into a tuner (doublet)

So is it maybe the fact I've already got noise is making this data noise detectable?

Maybe I should wait until the neighbourhood noise dies down and try it then.

Many thanks

About twenty years ago I had seen a run of mics where the felt over the element was completely covered in glue. Usually it's a little bit around the edges to hold it in place, but several were solid, like a sheet of vinyl.

<WBR

I stumbled across this on the CHIRP reflector, where someone was asking about programming the 706 memories. I think I have seem similar questions here. I was interested because I put a lot of time into programming my 706 mobile rig from the front panel and was looking for an easier way to duplicate the loads in my 706MkII which is replacing the 706.

The logging program YPlog has the capability to read and write memories in the 706 family of radios (among others). There are a few subtleties I

have deduced from my limited experiments.

1. The memory data table is not editable by common techniques such as
COPY, CUT, and PASTE. You may only enter and delete data in single fields.
2. You can program memories as splits for repeaters by loading a TX
OFFSET, however, contrary to the HELP file's claim, entering 600k will not set
the split to 600 kHz. One must use 0.6 (as in MHz).
3. YPlog can WRITE offsets to the radio but does not READ offsets from the
radio.
4. Memories P1 and P2 in the radio are 100 and 101 in YPlog and the
calling channel is 102.
5. The radio indicates that a tone is loaded into all memories where FM
mode is programmed. I'm guessing that they are all loaded with the tone that
is set in the radio's menu.

I used a Timewave HamLinkUSB cable, with the appropriate driver, of course.

Hope this is useful news. It was for me.

# 20900. Year & Serial Number for Mitsubishi Finals?

Yahoo group: ic706 (2010 — 2015)
Date: 2013-11-29 02:25:05 UTC
From: qrv@kd4e.com
Topic: 20900  Message: 20900

I may have missed it in the Files area but is there a mfg year
and serial number combo that flags a MK2G as Mitsubishi finals,
please?

Thanks!

You might try also the 706mk2g group.

Seems like someone said icom lengthened the digits in the serial number at that time.

Mine was purchased 10/05 from HRO and has them. The owners manual was changed if at all sometime later for it incorrectly stated the older part numbers.

I had to have the VHF /UHF one replaced once for unknown reason.
It's was extremely hot that day it went but so were other days.

# 20904. Re: [ic706] Re: Noise using ftdi chipset cat control cable

Yahoo group: ic706 (2010 — 2015)
Date: 2013-11-29 13:10:25 UTC
From: Mark gray
Topic: 20881  Message: 20904

Hi,

Many thanks everyone, it's pretty much sorted now.

Due to the noise going when the antenna was unplugged I figured it's getting picked up by my antenna/feeder. So lastnight I made a much smaller patch lead that goes between the radio and atu and put snap on ferrite on for the full length. About 7 or 8.?

All the noise from my cables have gone now also my laptop psu noise has disappeared.

The metre sits at 0 now mostly but I still have some frequencies which still have some.? This Is still likely to be from neighbours. (it goes late at night)

I can live with this.

Cheers

Mark mw0mkg?

Reply To: ic706@yahoogroups.com
Subject: [ic706] Re: Noise using ftdi chipset cat control cable

?

Many thanks for the feedback.

A good few things to consider.

The cable I got is exactly the Same one that is in the link from amazon.

One idea which mark picked up on was about unplugging the antenna.

Well I did that and it all went away.

I do have local noise anyway. It's probably a plasma or dodgy psu at a neighbours.
But this noise from the cat cable is another 'layer' on top again, That is to say I can audibly hear when the cable is plugged in.

I've tried 6 snap ons with no difference.

Just for the info I use 450 ohm ladder line going straight into a tuner (doublet)

So is it maybe the fact I've already got noise is making this data noise detectable?

Maybe I should wait until the neighbourhood noise dies down and try it then.

Many thanks

Mark mw0mkg

Paul Lutus appears to have solved the Icom 706-series
memory label programming challenge - if I follow his
rocket scientist (literally) explanation ...

Here's something written in Python in Linux but the author
says should port to a Microsoft version of windows:
http://www.arachnoid.com/IcomProgrammer/index.html

There's a link to an app here - with tone of limitations for the
original 706 & 706MKii and some for the "G" as well:
http://groups.yahoo.com/neo/groups/ic706/conversations/topics/18666

Here's the flrig control program:
http://www.w1hkj.com/flrig-help/index.html

Here's a different rig control app:
http://www.arachnoid.com/JRX/index.html

Here is another project:
http://sk3w.se/sm7lcb/remote/development_01/index.htm

There used to be some links here but the waybackmachine archives
didn't save the link content:
http://www.icomelmer.com/programming.html

Note the last sentence, which I have separated and highlighted, could it be that he got past the limitation?

"... the IC-706MKII, which, although fully operational, is far behind the times in a technical sense. But to fully exploit this new radio, I needed to replace my previous programming method written in Ruby. Among the problems with the prior method are that it didn't program memory names (alphanumeric labels), for those Icom radios that have this ability. (As it turns out, every one of my Icom transceivers accepts memory labels except the IC-706MKII.) Another problem was that the Ruby program didn't communicate with the radio very fast for a reason I didn't understand at the time."

*Both these issues are addressed in this new project.*

I'm considering a G-model but don't want to pay the higher
price unless certain of the finals and the seller is not
comfortable opening his rig.

If the Serial # is 15xxxxxx is it definitely Mitsubishi?

From: Bert Morton
Topic: 20910  Message: 20912

My understanding is that all the MKIIg's with serial #'s 15XXXX have the Mitsubishi finals.. I would also think that ICOM could confirm this.

Sounds fishy to me?

I can check my serial number tomorrow.

I glanced briefly at mine last night (706MkIIG) and it seems my serial
# is 1155... huh... do I really have that low a serial #? (I only had
a second and poor light but I'll double check it when I get home)

# 20915. FS: Icom FL100 500hz CW filter

Yahoo group: ic706 (2010 — 2015)
Date: 2013-12-05 02:53:50 UTC
From: John Geiger
Topic: 14545  Message: 20915

I have for sale an Icom FL100 500hz CW filter. Works fine, just decided to use a FL101 in my 706MKII instead. This model works in the 706/725/726/728/729/736/737/738/746/756/761/765/775/781 series of radios. It will not work in the 703/707/718 models.

I am asking $75 shipped for it and can take paypal/check/MO.

# 20916. WSPR on a Mac. mkIIg, signalink usb

Yahoo group: ic706 (2010 — 2015)
Date: 2013-12-05 08:33:31 UTC
From: <guenhwyvr@...>
Topic: 20916  Message: 20916

I've been trying to get WSPR to work on my mac, with little success. I can receive all day long, but whenever I try to transmit, I get the following error:

Error attempting to run rigctl.

rigctl -m 0 -r USB -s 4800 -C data_bits=8 -C stop_bits=1 -C serial_handshake=Hardware T 1

It's all greek to me. I understand that it's reading back my setup, but I don't know what (if anything) is wrong. When I acknowledge the error, the radio transmits, and I see it pop up on the WSPR website, but it won't TX without me acking the message. A little hard to do when you're thinking about letting it run all night for kicks.

Any help would be appreciated.

Details: Mac OS 10.9. SignaLink USB. RIGtalk CIV. Using the 13-pin DIN in the back of the radio.

Thanks!

Justin, N4ETC
(former KK4LSM)

# 20917. FLDIGI Signalink IC-706 VHF No Power Output

Yahoo group: ic706 (2010 — 2015)
Date: 2013-12-09 19:22:45 UTC
From: LARRY J. FORD
Topic: 20917  Message: 20917

Thanks in advance for any help, as I am "stuck" on a problem as noted above and described below:

I'm attempting to assist an ARES EC in a neighboring county with demonstration of FLDIGI/FLMSG/FLWRAP to his county's emergency manager this Thursday evening.

To do so, I need to operate FLDIGI with my Signalink and IC-706 ("original," no "Mark") in VHF mode to insure local propagation (NVIS HF "may" work, and is a fall-back, but we'd like to use 2-meter simplex to insure local communication).

I can get FLDIGI, my laptop (WIN 7 PRO) and the Signalink to "work" to the point of clicking on TX in FLDIGI, the program will output and trigger the Signalink into TX mode and the PTT light on the Signalink comes on. However, the IC-706 will not TX and there is no power output. I have run the TX knob on the Signalink almost fully clockwise with no effect.

The Signalink connects to the 706 via a cable to the 13-pin DIN ACCESSORY port on the rig, and I have changed the internal jumper on the Signalink as per the Signalink instructions from the HF "pin" to the VHF "pin" on the Signalink jumper box.

The IC-706 will not TX whether it is in VHF USB or FM mode. FLDIGI will "talk" to the 706 via a CI-V to USB cable to the laptop, it will read frequencies, change frequencies, etc. Running FLRIG (a companion to FLDIGI that acts as an "interface" between FLDIGI and certain rigs, e.g., IC-7200) makes no difference.

I'm stumped. I thought once I got the PTT light on the Signalink to come on, I was "home free."

Thanks,

Larry J. Ford

Verify
you are actually connecting PTT from the Signalink to Pin 3 of the
accessory connector.  I would guess you're connecting it to pin 7 which
is VSEND for MkII/MkIIG rigs but not for the original 706.

Well, I've "verified" enough that the Signalink instructions say connect the PTT pin (left side of the jumper block) to Pin 3 for HF and Pin 4 for VHF for the 706/706MKII (according to the Signalink instructions). I switched the PTT wire from Pin 3 to Pin 4.

What is "VSEND" for the original 706 if not Pin 4?

Hi Larry,

I Know that you are able to use Winlink. Why not use it instead. Your throughput will be substantially better and it is a better mode.

kevin/NB7O

# 20921. Re: [ic706] RE: FLDIGI Signalink IC-706 VHF No Power Output

Yahoo group: ic706 (2010 — 2015)

Topic: 20917  Message: 20921

Yes, I can use the Winlink system. I use the Winlink system a lot and love it, especially with my SCS P-III modem.

However, Winlink is NOT part of the conditions that have led to the test for which I posted a request for help.

These "conditions" include the fact that NC ARES is conducting a series of tests/exercises which dictate the use of MT-63 (a mode with which I am very familiar, due to its wide-spread use in MARS).

My issue is with the 706 NOT transmitting when the Signalink goes into PTT mode, not whether Winlink is better than MT-63.

Since posting, I think I may have discovered an error in the Signalink instructions for use in VHF mode with the IC-706, which may account for the inability to put the 706 in TX. Further experimenting tonight may reveal whether I am correct or not.

I am having a radio I sold returned to me because it was damaged during shipping.  I do not know the extent of the damage just yet but based on reports from the buyer it would appear that the sliding lock for the head unit was damaged and the RIT know on the head unit.  I am trying to get ahead of the game so I can fix this thing and was wondering if anyone knows where to find parts for an first gen IC-706.

Michael, This is an on going problem for a lot of people, I would suguest that you post it in all 3 of the 706 forums as well as on as many ham radio lists / forums that you can find looking for a control head. IF you have the micro surface soldering skills then you can fix it your self. if you do not I can help you as I have the skills and tools with several repairs under my credit now including my own 706MIIG where it had the trace failure problem.

I would call Icom for the sliding lock and the RIT knob. Those are probably used on the 703 and maybe the 7000 as well, so they are probably stiill in stock. I ordered the latch parts from them a couple of years ago with no problem.

Scott Malcom at MTS also will sell off parts from unrepairable units he gets from time to time.

I have an LDG IT-100 autotuner I'd like to use with
my recently acquired 706mk2g.

Do I need to build a cable or is one readily available
for a reasonable price?

I didn't see anything on the LDG or Universal Radio
sites.

Thanks!

Unless it's the wrong picture the connectors don't
match either the IT-100 or the 706mk2 connectors.

In the associate picture there's a 7200 connector
on one end & looks like two 1/8" connectors on the
other.

The IT-100 has a mini-din and the 706mk2g has a
13-pin connector.

From: LARRY J. FORD
Topic: 20928  Message: 20934

The ICOM IC-706 series (and virtually all ICOM rigs since the 706) has a 4-pin Molex connector on the back, in addition to the 13-pin DIN ACCESSORY Port. The ICOM AH-4 series, and possibly the ICOM desktop autotuner series as well, uses that 4-pin Molex connector as the AH-4 has a control cable with a matching Molex plug on the rig end.

Many non-ICOM autotuners now take advantage of that 4-pin Molex connector port by having an ICOM AH-4 compatible plug and control cable so that the autotuner can "emulate" the ICOM series and "make" the ICOM rig "think" an ICOM tuner is connected, thereby enabling the "TUNE" button on the front of the rig.

Yes, that’s the wrong picture.

LDG tells you to go to Cheapham.com. There you will find the correct cable as “LDG IC-7K Icom Interface Cable”

The one time I try to read the manual first ... arghhh!

Reading your post I then go and pull the rig further out than before
and now I see, hidden by the heat sink when I only peered over the
top edge, the 7200-type connector.

Sigh.

I've got that one! :-)

Thanks!

# 20938. Interfacing RigBlaster Plus

Yahoo group: ic706 (2010 — 2015)
Date: 2013-12-18 18:25:35 UTC
From: <kb8cmw@...>
Topic: 20938  Message: 20938

Hello to the group.
I'm trying to interfacing RigBlaster Plus to my IC-706 M2G.
Using ACC jack on the back of the rig,and Dell laptop which
doesn't have serial port.I receive fine but no transmit.I've turned
off option #30 in 706 to off.If I short the cable marked PTT out
of ACC jack I see the rig key up.The cable marked PTT I've wired
to RigBlaster.

Any ideas?
Thanks
Paul

"have looked online and there is nothing that is just for the european models."

What about duplicating the jumpers in the US model?

For example, there might be jumper 3 and 7 in the US and only 9 in EU. Remove nine, add 3 and 7 turning it into a US model. That's just an example, I haven't looked at that in this model, but several of my other rigs since the 90's have worked that way, some service manuals even show the different configurations for different regions.

I guess the first place to start would be finding a US MARS/CAP mod pic, then compare that to the jumpers you have.

IZ2BKT has released a beta version of the suite BktRemote. I tried the version for Smartphone Android and, even if it is a beta, works fine on local WiFi network. With the Smartphone can use the IC-706MKII/G changing frequency, mode and filter, to hear the audio being received and transmitted using the same smartphone.

How much do you like to open up the vhf band?

Years ago i owned a 706MK1 (europ.) an did a mod to open up from 140 > 162 MHz.
This is the range where the bpf is usable. Sending outside this range will cause spourious signals.
The only problem, the file i have is in german language but i found a english one on the net, which is
basically identic.
So drop me a line and I send both.

Hi Everybody;

Gary Pearce (KN4AQ) is presenting the MDSR project in his 116th. episode of HAM Radio Now.

You can watch his take on the show and introduction followed by the talk given by Alex Schwarz (VE7DXW) about the MDSR project.

Your transceiver, a computer and a LIF2012 kit is all you need to experience the MDSR software and turn your rig into a SDR radio.

Here is the link:

# 20947. Audio problem on fm only

Yahoo group: ic706 (2010 — 2015)
Date: 2014-01-04 23:21:10 UTC
From: ko6r
Topic: 20947  Message: 20947

Refined description of my audio problem on the 706MkIIG:

When I power it up, I cannot get any audio out on VHF FM.
After the rig has warmed up for about 15 minutes or so, it works fine.
New data:
There is no problem at all on VHF USB. Works fine right after power-up.
If anyone has any thoughts about what I might do, before I send it off at what will probably be considerable cost for diagnosis and treatment, I'd appreciate your letting me know.

Thanks in advance,
Peter KO6R

I used to always get nailed because squelch one way was RF gain the other.
I reprogrammed the knob, squelch off in SSB, full RX gain. Didn't seem to
make sense to go from a reasonable FM squelch to a dead RX when switching
modes.

Has anyone tried this?

http://www.ebay.com/itm/PSK31-Interface-Full-CAT-for-Icom-IC-706-All-versions-/370543269051?

Sure sounds like a terrific deal, compared to other interfaces,
at $42.99 shipped.

I have a USB-Serial adapter cable (if I use a computer without
a serial port).

Am I missing something?

I have this cable. It works well for remote operation of my 706M2G.
The only drawback is that the computer loads down the microphone
circuit, even when the computer is off. I unplug the mic for remote
operation and the computer audio cables (or the 13 pin cable at the
radio) when I operate the radio locally. My computer has a serial port,
so I haven't tried it with a USB adapter.

I have the "original" IC-706 and an IC-706MKII.

The so-called "MARS" mod (i.e., transmit 160-6 meters continuous coverage) is, indeed, the removal or disabling of diode D-59 for the IC-706.

However, as I recall, the "MARS" mod for the succeeding editions (e.g., MKII and MKIIG) required increasingly more complex steps.

I'm getting ready to the mod on my IC-706 (looked at it just last night), but fortunately I purchased the MKII with the mod already performed.

If it works, probably a good deal.

Note that the website specifies that USB/Serial adapters/converters must have
the FTDI chipset, which is very good advice.

Do you mean transmit or receive audio? If it's on transmit it could be the FM VCO needs a tweak.

Sorry, probably wasn't clear enough. The problem is with transmit, not receive. Some component or a board is heat-sensitive, and doesn't get functional until warmup reached, after about 17-20 minutes.
I'm sending it off to a repair guy up in WA today -- he comes recommended highly by local HRO folks, and we've spoken on the phone.

Thanks for the observations/ideas.

That problem is often caused by an adjustment inside the  706.  Not sure what it is now, but a search for the porblem with google should find it.  Something like the FM VCO.  I adjusted one for a fellow ham several years ago.  It is also possiable it may not have been soldered correctly at the factory and is not making good connectio.

Check your power supply to ensure that it is supplying sufficient voltage to the rig.

I get the clicking sound on my 706 MKII when attempting to power-up from a source that does not provide sufficient voltage to meet the rig's requirements.

Assuming the correct voltage , it is probably a capacitor that has gone bad and eaten up a trace on the printed circuit.  Sometimes takes out a resistor and diode.

If you do a Google search for this, you can probably find a web page about it and it will tell you how to fix it.  I have seen this problem and how to repair it on ther internet a few years back.

My 706 did this and I sent it to a repair shop.  I am not equiped to work on the very small devices.  It cost me just under $ 100 US including the shipping back to me.
Probably about 2 hours labor and almost nothing for the parts.

That is where I would check first.  Either a bad solder joint or the capacitor needs adjusting.
That problem seems to only effect the FM transmitt.

Mine does the click and I have no audio. I have been debating on sending
it in. Can't wait to see the charge for that one.

# 20973. Which Heil HMM Mic recommended?

Yahoo group: ic706 (2010 — 2015)
Date: 2014-01-07 17:49:09 UTC
From: qrv@kd4e.com
Topic: 20973  Message: 20973

If one were to choose one of these for a 706mk2g, which would it be,
and why, please?

"The unique design of the HMM eliminates the hollow, clam shell sound of
hand mics of the past. This has been achieved by designing an open grill
on top of the microphone case which detunes the internal hollow
resonance of the housing."

HMM is equipped with a full range dynamic microphone element

HMM-iC is equipped with our iC electret element.

They were just offered for pre-order here:
http://www.dxstore.com/heil_microphone.html#hmm

I believe you'll need to use the mic with the electret mic element for the MKIIG.

Hi group!

I have tried to locate my source for this information, but can't put my finger on it right now. I remember reading that Heil designed the stock handmike for the 706 series. Supposedly it is designed especially to get the best sound possible out of a handmike and this radio.

From: LARRY J. FORD
Topic: 20950  Message: 20977

Apparently, you are correct, all the 706s are removal of one diode.

706 - D59

706MKII - see
http://vss.pl/mods.dk/mods.php3-radio=icom&model=ic-706&selectid=244.htm#244

706MKIIG - D2030 (see http://www.marsregionone.org/Tech/IC-706MKIIG_OBM.pdf )

I was probably thinking of my IC-7200, which is more involved than the 706s, and I elected to send it to ICOM Service Center Michigan to let Matt Adrian do the MARS mod.

However, note the following from (http://vss.pl/mods.dk/mods.php3-radio=icom&model=ic-706&selectid=1663.htm#1663 ):

"Author: Emory - KD3DQ

Ref Xmit Mods for 706s shown above

The xmit expand mod for the IC-706, MKII, MKIIG require removing very small diodes, these diodes are about the size of a flea, and require the use of very small tools.

I have done mods before but these are difficult.
After lots of thought I did my mod with an x-acto knife. I needed a magnifing glass and a new blade for the x-acto knife. I cut just the solder on one side of the tiny diode, making sure that is all I cut, then pushed up on the diode, the other side breaks loose from the board. I cut both diodes this way and it was easy and worked fine.
I could not find a soldering iron small enough to fit into tiny space available. Good luck.... Emory KD3DQ"

Date: 2014-01-08 11:13:53 UTC
From: gjtkd617
Topic: 20979  Message: 20979

Hi all
Just wondering if anyone has come up against this problem before
706 original was all working fine turned it on yesterday and volume came on full there is no response from af or rf/sql at all the radio has had little use since I have owned it and the af/rf/sql knob has been replaced around 6 months ago as the old one had snapped off outside
so I don't think the problem is there
Many thanks
Glyn

# 20980. MkIIg has died ... :'(

My MkIIg has worked wonderfully for me for the past six years or so since I bought it off eBay. Now something is very wrong with the audio - it is just plain noisy and scratchy. I think the problem may be the aftermarket DSP that the previous owner installed. I have decided not to even attempt to repair it and bought an IC7000.off eBay.

Is anyone interested in buying it as a project? I have a separation kit and mounting kit that will come with it. I know that eBay has auctions for "parts only" MkIIg in the $300 and I think mine is comparable. Plus the mounting kits.

Any interest or offer will be considered, please contact via email.

All the best, 73s

:I did the mod by simply crushing the diode with a pair of long nose pliers
: just make sure you crush the right diode

I've done that in the past, but find too much of a risk of the pulverized part/solder flying into other parts, getting stuck between pins on chips, et cetera. More than once I've had to use a needle to pick metallic pieces from between the pins of a chip. I have had good luck cutting the trace to the diode with a small exacto knife.

My first inclination would be to suspect the replaced control knob. I would look for a cold solder joint, or possible damage to a trace on the board near the control that may have been damaged when the original control snapped off.

After years of troubleshooting I have learned to start at the last thing that was touched. Many times this finds the problem.

What if you put a vacuum nozzle down next to the diode before it is
crushed. Wouldn't that catch flying fragments?

... flying fragments and considerably increase the likelihood of ESD damage? Using lightly magnetized needle nose pliers gently should prevent flying fragments and contain any ferrous particles. Then pressing a finger down on the serviced area, after discharging & bonding oneself, would remove any remaining non-ferrous crumbs, as would quickly flipping the unit over and dropping it onto the work surface from an inch or two up. However, cutting a trace would probably be the safer bet, and it could be bridged if it became desirable to return the unit to original condition.

Hi Glyn

That's a 'co-incidence' - I would suspect bad workmanship or bad new components? Snapped off ?? sounds like a major impact to do that and that may have caused adjacent weaknesses and the repairer was not likely to see it/them until it/they failed completely - like now. Suggest you send it back for investigation - 12 months warranty isn't unreasonable.

I have done mods on several radios that require the removal of a surface mounted resistor. My technique is to use a soldering iron that has a wide tip instead of a point. The tip on one of my irons is just wide enough to span the two connections on the resistor and the resistor ends up sticking to the end of the soldering iron. Quick and simple.

@Kurt: Thanks for the idea, I had thought about attempting to diagnose it myself. The reality is that I have never cracked the case and don't really want to do so now. I just bought a 7000 instead - lazy, I guess.

@Don: Sorry for not responding in a timely manner, I will contact you this evening - you were the first to express interest and thus get first dibs.

@Dave: You were the second to express interest.You asked about cosmetics - the unit has been used mobile, backpack and base station and has the normal surface conditions (rubbing and scruffing and light scratching - no cracks or big scratches) that one would expect from a well-used, but cared for unit.

@Bruce: You were third to contact me. I am in New Mexico.

Thanks!

Miles, KC7PHK

Do you want to sell your control unit (faceplate) and accessories?

Mine was stolen.

I have noticed latley while I was monitoring a local 2m repeater that the squelch will slowly start to crack open. I can readjust it to silence the rig, then after about 5 minutes it will do it again.. and again.. and again

has anyone ever noticed this before?

Sounds like a component in the squelch circuit or the control is changing values/going bad. How old is the 706?

Does it act the same way without an antenna connected?  That would isolate if it's a radio fault, or errant noise on the band.

Is it simply the squelch opening up or is the noise floor rising? I had a somewhat similar issue couple years back with my 706G. On mine the noise floor would rise slowly and totally wipe out the repeater. N1EQ repaired mine and told me it had to do with faulty trimmer caps in the VCO circuit.

> Good point Mark! I will check tonight!

Let it cool off for a few hours, then put a dummy load on it and turn it on. Monitor it for several hours and see if it happens again. If it does, it is a temperature problem in the squelch circuit. I don't know if the 706/7000 series has an issue like this or not, but some radios do.

If it does not do it after several hours, put the radio back on the antenna and check your noise level coming into it. It may be varying at times. Some receivers work properly and don't open squelch when noise raises (assuming FM here), and some don't do so well and open up even though it is just noise. I've never used the radio on FM, so I don't know specifically if this series has a good squelch circuit or not. If it is noise, and the receiver responds to it, tighten the squelch and consider that your normal setting.

# 21001. ic-706MkIIG won't receive nor transmit

Yahoo group: ic706 (2010 — 2015)
Date: 2014-01-23 05:40:59 UTC
From: <okz00k@...>
Topic: 21001  Message: 21001

Preamble
~~~~~~
I recently unpacked my IC-706Mk2G which had been in storage for the past 8 years, and installed it in my car for portable use. Initially all worked fine. I installed a new Nagoya S-80 dualband VHF/UHF antenna and has a brief QSO via a local 2m repeater. Then installed an HF whip antenna (tuned to 7.135MHz) and had a listen around 40m, checked the VSWR at the radio feed point with a COMET CA500 (1:1.2 at 7.135 and better than 1:20 from 7.090 to 7.195). Then listened around the 580kz-1.6MHz AM checking out the broadcast services - all good.

After an hour or so of listening around and a brief QSO on 2m, I noticed the chassis a bit warmer than expected and turned the rig off.

After turning it on again a little later on I had a problem.

Problem Symptoms:
~~~~~~~~~~~~~~
1. Radio will not transmit on any band.
2. No reception heard, as if no antenna was connected, or the RF pream was missing.
3. All control panel controls function as expected.

I get audio noise out with AF gain and in FM and AM modes noise ceases with slightest Sqlech on.

I put my old IC-706 (Mk1) back in the car and it works fine on 2m and 40m with the same antennas and connections, however the IC-706MkIIG is now dead.

Any suggestions?

# 21002. Lots of Icom 706 accessories for sale

I have quite a few accessories for your Icom 706 series radio for sale. All prices include shipping in the US, and I can take paypal/check/MO/cash.

Here is what I have available:

1. FL223 1.9khz SSB filter ($130 new) $80
2. FL100 500hz CW filter ($120 new) $75
3. FL232 350hz CW filter ($120 new) $75
4. UT-102 voice synthesizer ($85 new) $55
5. UT-106 DSP Unit ($150 new) $75
6. OPC-589 8 pin round to RJ45 adaptor, allows you to use desk mic with 706/7000 and FM radios ($40 new) $25
7. OPC OPC-599 13 pin ACC plug to 7 pin + 8 pin jack adaptor, good for using with amps and things like that ($75 new) $50
8. OPC-581 front panel separation cable ($60 new) $40
9. Heil mic adaptor to 8 pin round for Icom ($40 new) $25
10. Photocopy of Icom 706MKIIG service manual $6
11. Homebrew keying interface designed by W4ETN. Plugs into 13 pin ACC jack and allows you to key any amplier, including the old vintage ones. Asking $20

Let me know if you are interested in any of these and we can work out the details.

Sad to hear that - sounds like the c/o relay to me - if your not skilled then you'll have to send it back to ICOM to fix. You could spend days weeks months looking the cause and then fixing it when they could do it in the day.

I have for sale the original (not a photocopy) operating manual for the Icom 706MKII in used but good overall condition. It has a slight tear on the cover, but is perfectly usable and looks pretty good overall. It will come with the 1 page (printed on both sides) Icom 706MKII operating guide, which is on thin cardboard and shows how to navigate thru all of the menu items. In addition I have a photocopy of this operating guide-keep one in the house and one in the car.

In addition, I have printed from the internet (mods.dk) a list of all of the mods for the Icom 706MKII.

Finally, I am including the Icom full color 1 page (front and back)sales bouchere for the Icom 706MKII. It shows a nice picture of the rig and lists the specs and options for the rig on the back.

I am asking $15 shipped for all of this in the US, and can take paypal/check/MO.

# 21016. Low/no output issue

Yahoo group: ic706 (2010 — 2015)
Date: 2014-02-06 21:57:55 UTC
From: w2dhb@...
Topic: 21016  Message: 21016

I took my original 706 mobile rig while visiting and set up an 40/80 trap dipole to operate portable. It worked fine on both bands for several days, then started having issues with low Power Out reading on 40 (7.150) and 75 (3.990). I checked the dipole and my antenna analyzer indicates 50 ohms on 7.150 and 85 ohms on 3.990 at the ant with a 9' cable or at the rig with 109' of cable. I have an LDG IT-100 tuner to use it on multi-bands and when used it brings the SWR to 1.5 or less on the 706. Sometimes after some testing it will work normally (modulation peaks PO metering) on 40/80, otherwise PO reads about third of max on 40 and barely moves on 80. It works all the time on 15 or 20 meters (max PO scale under modulation).

This intermittent issue has got me baffled, anyone had this issue with the original 706?

Pat, W2DHB/4

Topic: 21016  Message: 21017

Make sure its OK on a 50 ohm load first. I have not had any useful results with the LDG 100.

All the 706 series can have a problem with the inbuilt SWR bridge. The trim capacitor is small and can fail resulting in wrong FWD and REV power sample readings for the metering. When the radio thinks there is a mismatch, the shutdown cct cuts back the power.
The cap. can be replaced with a fixed value cap. of around 4pF but it needs to be selected under test.

The service manual has the procedure for calibrating the FWD and REV power metering. its fairly simple but requires 2x 50 ohm loads available. Check this first, then open the covers and look for the earthing strips that should be in contact with the covers, also check the boards particularly the filter board is tightly screwed down.

I have an extra separation cable for sale.

It's in the original ICOM box.

Asking $95., or best offer, including standard USA shipping.

# 21021. Has the yellow wire mod been done on my ic706?

Yahoo group: ic706 (2010 — 2015)
Date: 2014-02-20 09:49:10 UTC
From: <rick.g6uzt@...>
Topic: 21021  Message: 21021

Chaps.
I've just acquired an ic706mk 1 but I'm not sure if it's had the yellow wire mod.
The radio receives FM band 2 ok and I was told that if that's ok it may have been factory modded.
Can some one confirm how I can check?
Cheers,
Rick

# 21022. New version of the MDSR – V2 .8 is available for download.

Yahoo group: ic706 (2010 — 2015)
Date: 2014-02-25 17:59:49 UTC
From: <alexschwarz237@...>
Topic: 21022  Message: 21022

Hi Everybody;

MDSR V2.8 is now available for download (includes Manuals in PDF)

MDSR has again concentrated to bring you the best audio quality out of your existing analog RIG by turning it into an IF SDR. A simple and reversible modification on many analog transceivers is all it takes to connect the down converter (LIF2012 – available as kit) or the BiLIF (also a kit) to the soundcard of the computer (Win XP, Vista, 7, 8). MDSR works with any symmetrical HF transceiver.
Please check:
http://users.skynet.be/myspace/mdsr/ http://users.skynet.be/myspace/mdsr/ (click on MDSR kit and Installation)

The MDSR team has been hard at work to make the setup and calibration of the MDSR software and the BiLIF unit as easy as setting a level. All the real time level indicators have been integrated with the filter adjustment windows and no external measurement equipment is needed. Download the software manual or the MDSR software from our “Downloads” page.
You do not need to be an expert to build the LIF2012 and Bi-LIF kit. It is simple and straight forward and anyone with soldering experience (no SMD) can do it. Check the PDF document on “How to Build and setup the LIF”.

If you are interested and want to find out what other HAMs have been doing with the MDSR please join our Yahoo user group, where we have a big collection of pictures and a forum where you can post questions.
https://groups.yahoo.com/neo/groups/mdsradio/info
https://groups.yahoo.com/neo/groups/mdsradio/info

The MDSR software is free to use for amateur radio operators.

All the best and 73;

The MDSR TEAM

From: <wayneaa5jj@...>
Topic: 21024  Message: 21024

My 706MK2G after turning it on after a bout 3 to 5 minutes it will start turning it self OFF then Back ON. It will keep doing this over and over and it may stay on for a few minutes but keeps on going OFF and ON. I have looked all over the internet and checked all the boards to make sure they are tight and they are checked the power cable and fuse's inside and out, Still does it. Any help will be greatly appreciated. Thanks in advance to anyone that reads this whether you can help or not.

From: Ralph Mowery
Topic: 21024  Message: 21025

I have one that did that. It finally would not come on at all. Sent it out for repairs. Seems there is a capacitor or rubber pad that leaks and eats up the foil traces and usually takes out a resistor and diode.

I would goto this web site and look at the problem and cure if you can work on the equipment.

http://www.n1eq.com/tech/page_03.html

I sent mine off here and it came back in around 2 weeks from the day I put in UPS and cost just under $ 100 including the shipping back to me.

http://www.sarts1.com/

I think I included a note that if it was under $ 200 not to call me, just repair and ship it back.

As mentioned on one of the web pages, make sure to check the power supply, fuses, and the molex plugs for loose or bad connections first.

# 21026. Problem 6 Pin Data Port

Yahoo group: ic706 (2010 — 2015)
Date: 2014-02-26 20:29:30 UTC
From: <ic7461@...>
Topic: 21026  Message: 21026

I've been using my Icom 706MK2G for PSK31 for quite some time now and have it connected to my 6 pin data port and worked great up till yesterday. The interface is a USB Signalink. I have lost both USB,LSB power output with PSK31. The radio keys fine in all modes but just no output, all normal carrier modes are ok. The microphone input audio works fine in SSB. I have a friend that has the same problem recently with his IC-7000. No audio input at the 6 pin data port. He also uses a Signalink USB interface soundcard. He just inputs now from the microphone connector.
Has anybody seen this occur with their 706's?

I have a MKIIG that has recently been repaired by Icom to replace an overheating resistor (R291) 22 Ohm, which became open thus loosing the 5 volt rail from the regulator IC291
I have noticed that both these resistors get too hot to touch without burning your finger off, does anyone know if this is normal for them to be so hot?, as the radio seems to be operating ok, the input voltage is around 14vdc
Any Ideas anyone?
Thanks

How about - they've probably fitted the exact same resistors again which is what they are paid to do i.e. don't make any local decisions.

I'm thinking I would be replacing those resistors with something bigger.

what is the input voltage from your power source. is it a battery and charger or is it a power supply?

it sounds like a PS and the radio is getting 14-16 volts and that is too much for it to handle it wants to see 11-14 volts 13.6 is what they are set up to have on the input.

Don't know about your 706, but mine will start distorting audio like heck once the input voltage drops below 12.0 VDC.

Spec is 13.8 VDC, plus or minus 15 % (2.07 VDC), so the low end is 11.73 VDC, according to book spec, but mine will not really function that low due to distorted audio.

TX, as that draws the higher current, which will obviously drop an already low voltage condition even lower.

RX is OK at lower voltage levels as far as I can tell.

I'm loving my 706 I'm using mobile.
I've been making son fantastic DX contacts,
I've found that if I can hear em, I can work em.
Some of the countries worked so far are;
Russia, Germany, France, Spain, Holland, Ukraine,
Australia, and all over the U.S.
Strictly barefoot, into a Pozy screwdriver on the
back of my '91 Buick Park Ave.

Talking to the locals on the repeater is nice, but
working someone on the other side of the globe is FUN!!

I've also got a 706 in the shack, but the one in the
car gets the most use by far.

~~~~~~~~~~~~~~~~~~~
Knee-deep in the cosmic overwhelm, I’m stricken
by the ricochet wonder of it all: the plain

everythingness of everything, in cahoots
with the everythingness of everything else.
~~~~~~~~~~~~~~~~~~~

I changed vehicles recently, haven't gotten the HF antenna on the new
truck yet...
... but my "original" setup in the old truck was a FT-2900 for 2M, and
an old Radio Shack HTX-100 (I think) for 10M
It had a detune problem at 'full power' of 25 watts, but worked fine at 5W.
I used to work Europe on it from Jacksonville FL.

When I got the 706, original flavor, man, I felt like I was King of the World.
Jumping from 5W to 100W was just wonderful.

Favorite QSO - 20m with a Hamstick, about 6PM local time on the way
home from work...
Two gents with Vxxxxx calls talking. I figured Canada. At one point
one of them asks, "Anyone else out there?"
I jumped in, said Hi... Talked to one of them for a bit, then he said,
"Want to talk the other guy?"
I said,"Sure, I like Canadians"
Second guy jumped in,"I'm Australian, mate."
Here I am in Starke,Fl, a tiny little cow-town, talking to Canada
_and_ Australia at the same time.

hi ron-- I have the 706mk11g, sensivity is excellent. also have the 250 hz cw filter. work that with the passband tuning and you have an unbeatable combo.. if you are on six meters, when may thru august comes and the e-skip comes to your qth enjoy.. I have qso with Europe, Caribbean, south America, and a lot of the eastern half of the usa .. . my qth is about 55 miles north of nyc. we use grid squares in 6-meters, if not familiar with grid squares, just look em in a search engine... happy dxing--steve--wb2oee

I'm loving my 706 I'm using mobile.

I've been making son fantastic DX contacts,

I've found that if I can hear em, I can work em.

Some of the countries worked so far are;

Russia, Germany, France, Spain, Holland, Ukraine,

Australia, and all over the U.S.

Strictly barefoot, into a Pozy screwdriver on the

back of my '91 Buick Park Ave.

Talking to the locals on the repeater is nice, but

working someone on the other side of the globe is FUN!!

I've also got a 706 in the shack, but the one in the

car gets the most use by far.

~~~~~~~~~~~~~~~~~~~~

Knee-deep in the cosmic overwhelm, I’m stricken

by the ricochet wonder of it all: the plain

everythingness of everything, in cahoots

with the everythingness of everything else.

Thanks for all the suggestions

The voltage input has been 14.2Vdc delivered from the alternator of the vehicle where it has been running daily over the last 6 years, I suppose they might have been getting this hot on a regular basis until one of them gave out, as they are both in pararell, it would be interesting to see if anyone has also had to replace one of these or if they could check if they also get to this high temperature on another rig,
The resistors can be seen on the PLL board under the set, two of them side by side, rectangular chip type, with 220 stamped on them R291 & R292.

Thanks Again

Sergi ZL3SL

I noticed something odd on my MKII G on 15m and 17m. Often when I key the mic in SSB, I have power indicated out without any audio input. I check to make sure that split isn't on, and I'm in SSB mode during the time the mic button is pushed. I can push it several times and get power out on my HM-102 meter, and then it will just quit showing any power out until I speak into the mic. If I wait a few minutes, this anomoly will start again. I watch the diplay to make sure it isn't changing modes when I do this, and it still says USB.

Sometimes the power stays full up when keying the mic, sometimes it shows full and then drops to zero over about 3 seconds, sometimes it's momentary before falling to zero, and other times there is no indication out as it should be and that's the way it is on all other bands.

This doesn't occur on the other bands in SSB TX. Anyone ever experience this?

Topic: 21043  Message: 21043

When I key the mic in USB on 17m I get indication of power out on the display and also an inline meter, even with no audio input. If i rekey three or four times it will quit doing that. It's like a carrier is being thrown. I watch the display to make sure that it is in fact in USB when it is keyed, and no split or other function is on.

It doesn't do this all the time, but only on occasion. If I hold the mic button down, sometimes the power will drop to zero in about three seconds, sometimes not. As I said earlier, rekeying several times will stop this from happening.

This only happens on 17m and not the other bands. Anyone have an idea what is the problem?

This seems to be a common problem.  Look here for a simple fix.

http://www.ad5x.com/images/Presentations/IC706InstabilityRevA.pdf

Seems that one of the circuit boards is not grounded correctly and causes the 706 to oscillate.

Yes, I'm in a hurry now but it's a known problem on 15 & 17. If your lucky you can get by with tightening all the board grounding/ mounting screws.

I've got some emails saved on the subject.

There is some info on www.ad5x.com including a link to icom service bulletin about the ground springs.

If that ad5x mod and reseating doesn't help, some have used a counterpoise. I'll look for that.

Here's text from a previous thread on the 706mk2g group.

73
Mike R

I use a 8" diameter 7 turns of LM400 choke about 3' from the antenna feed, gets rid of the spurious noise. Antenna is a Hustler 6BTV + 17, 12, and 6 meter add-ons that I designed. Feed is from a 706MKIIg, or IC-7000 via an AT180 auto tuner.

pat NE6PG

On Fri, Oct 25, 2013 at 1:29 PM,kawill70@gmail.com wrote:

Mike - I don't recall anyone mentioning a counterpoise, but several amateurs have used 7 meters of coax between their antenna tuner and transceiver. See the earlier posts in this thread including the link to eHam.net.

The additional coax changes the impedance seen by the radio at 11 Mhz. The low impedance capacitive load is rotated to a higher impedance inductive load at 11 Mhz. You can visualize this on a Smith Chart. However, I think the desired length might be different depending on the specific antenna and the type of tuner. The 7 meters of coax was based on a measurement of 1-j30 ohms at 11 Mhz.

Thanks for the tips! Problem solved...apparently it was the grounding spring problem. No longer is there oscillation on 15m and 17m.

I loosened and tightened the board screws and sanded the inside cover where the springs contact. I didn't see but faint evidence of the spring contacting the cover on the paint.

My MKII G must be a later model as it had the spring mod installed that was mentioned in an earlier link about the service bullitin...although the spring mod looks like it makes minimal contact to a screw post. I would think the solution in the link would be more reliable in making a ground.

Thanks to all and 73.

That's a VERY clear sign that SOMETHING is unstable. If it only happened on the antenna, I would suspect something else. Do the grounding and be done with it.

Hello All,
A very good friend of mine asked me to see if I could repair his Icom 706 Mk II G. The radio works great on UHF / VHF, But real low power output on HF, about 10 to 15 watts output with the power level at high. No signs of anything burned up on the PA board, nothing discolored in any way. This is a newer version that has the RD 70HVF1 finals. Can anyone give me some advice to track down the problem? I have all the equipment here to repair the radio with the exception of an RF probe for my DVM. Thanking you in advance, and hope to hear from someone about this trouble,73.

There is a way to internally lower the power for the different bands. Have you made sure that it hasn't been lowered to that level, maybe to drive an amp?

Good luck with your troubleshooting.

Hi,

It is also worth checking the power output as you go up the hf bands.
I had an issue on mine that was lowish at 80 m and increased as I went up to 10 m.

Mine was a crook diode in the swr detection circuit. It went leaky. Replaced the diode and all was good again.

Cheers.

Hi

No they are schottky diodes. I forget the number but they are double diodes in a small smd sot23 type package.
There are two of these diodes, one for fwd power and one for reverse.
When I dig the manual out I can tell you.
I think the PIV is a little low for the application they are in. I used a different type which work just as well.

Cheers,

Simon

#2 to that. Mine would output only 20-30w across HF/6 meters but an easy fix when I found it.
If this is the issue and you order a replacement off ebay then pay attention to the part number suffix because of the device polarity.
Dont ask me how I know.

Hi,

It is also worth checking the power output as you go up the hf bands.
I had an issue on mine that was lowish at 80 m and increased as I went up to 10 m.

Mine was a crook diode in the swr detection circuit. It went leaky. Replaced the diode and all was good again.

Cheers.

Hello All,
       A very good friend of mine asked me to see if I could repair his Icom 706 Mk II G. The radio works great on UHF / VHF, But real low power output on HF, about 10 to 15 watts output with the power level at high. No signs of anything burned up on the PA board, nothing discolored in any way. This is a newer version that has the RD 70HVF1 finals. Can anyone give me some advice to track down the problem? I have all the equipment here to repair the radio with the exception of an RF probe for my DVM. Thanking you in advance, and hope to hear from someone about this trouble,73.

Hi Simon.

You originally said "Mine was a crook diode in the swr detection circuit."
Was wondering, is "crook diode" another name for a "schottky diode"?
Hadn't heard of it before.

I've used a 706 for about 9 years although mostly a k3 the last 3 years.

I do ssb 100% and never found occasion to use the notch filter much but after putting the rig back in the dodge, I was pushing buttons trying to reduce noise.

I found the notch filter made a noticeable difference. I had the 1.9 narrow filter engaged, NR at level 3 and the notch filter which really helped. Of course audio sounds better with notch off because it seems to notch the highs of the voice also but a good tool to remember for me.

Hello All,
I checked the amp meter on the power supply, on ten meters and SSB, The amp meter shows the radio to be drawing 10 to 15 amps, but the inline power meter shows that I am only putting out about 10 to 12 watts. Any ideas what could be causing this???, 73 for now.

Is the heat sink getting hot? 10 Amps @14 volts with 50% efficiency should be about 70 watts output. At 60-70% it should give near 100 watts out. That’s about what it is rated at anyhow. It may not be too far off. Maybe the rig power is dialed back and the excess is going up in heat from the heat sink????????? I don’t know the theory of how the power output regulation works so someone else will have to chime in.

If measuring power output on SSB, you must have true, active peak reading wattmeter to display the actual peak output.

Most watt meters are average reading watt meters, and the average output on SSB with 100 watts peak output may well read in the 10-15 watt range.

What does the rig show when in a constant carrier mode?

First, try to measure power in CW mode, where you can get
a meaningful reading. To measure power in SSB you need a
continuous tone generator for the reason already explained.
Also you may switch in the voice compressor and set the
gain and compressor levels a bit higher, as I have done
with my IC-706 MkII (not G model).

Hello Costas,
I checked the output in CW mode on 10 meters, with the power setting at 3, the output was 8 watts, from the setting of 3 all the way to high, the output is only 12 watts maximum, no more increase in power is noted. I tested the diodes D9 and D10 on the SWR circuit with my diode tester and both diodes are good. no shorts. Any other help with testing will help, 73 for now Costas.

I suspect a fault in the ALC circuit, because you get reasonable
power levels at low settings which level up at higher settings.

Found the problem with the radio, the driver board has a bad driver for the HF/50mhz. Called Icom parts and was told that they will not sell the board to the public, they are only allowed to issue them to the repair dept. If I want it fixed, to send it in and it will cost $482.07 plus shipping for both ways. Since this radio has been discontinued, they will not have any more driver boards made for them, so when their stock runs out. you will be told that your radio is no longer serviceable. Apparently the had problems with this board and had to replace them in several radios to the point that they have exhausted their supply. I am not too impressed with the way it is being handled, an obvious factory defective board. 73.

Is it a physical defect in the board or the inability to replace the defective component ? I realize that SMT devices frighten some people and board replacement is a quick way out. I had the complete RF rear end smoked and I was able to get the SMT pre- driver from RF Parts for under $20.00

# 21079. 706 with reset issue

Yahoo group: ic706 (2010 — 2015)
Date: 2014-04-14 00:33:11 UTC
From: <bruce.clements@...>
Topic: 21079  Message: 21079

Hi Folks. I posted this once before but I thought I would toss it out again. I have a 706mk2 that when you power it up it does a CPU reset which is Band up/Band down and power at the same time..The band up/down don't work in that mode BUT in a sub menu they work. I have measured the CPU reset line at the CPU and the voltages are present and different depending on which of the Band buttons is pressed. This eliminates any open traces etc..

Here's the big question, does anyone know the exact voltages on a normal CPU. The reason being
this unit was hit by lightning and the Up/Down worked but quit shortly after the rest of the unit was repaired. I have the unit on the air but with some work around.

I was starting to wonder if a hole has been blown in the eeprom map.

Thanks
Bruce

Does anyone make a remote display for a 706?
I saw a post about a tablet display for a IC-7000
the other day and it got me thinking about how
nice it'd be to have one for my 706 in the car.
My radio is mounted right in front of the seat where
my hand goes right to it when my arm is on the
center armrest, but the display requires me to take
my eyes off the road to read it.

I think the closest you will get to a "remote display" for an IC-706 is to connect it (via the CI-V port) to a PC running HRD or similar program and thereby gain some "limited" external display function.

The IC-7000 is a totally different "animal" than the 706 series, being much more digitally-capable than the 706 series (digital connectivity being pretty much limited to the CI-V port). The IC-7000 has a port that will output the video displayed on that external digital display that you see advertised for the IC-7000.

To my knowledge, there is no similar capability or function with the 706 series.

# 21086. MDSR - BiLIF goes portable with ASUS U7 USB sound interface

Yahoo group: ic706 (2010 — 2015)
Date: 2014-04-25 18:26:09 UTC
From: <alexschwarz237@...>
Topic: 21086  Message: 21086

Hi Everybody;

MDSR (Modulation – Demodulation Software Radio) has been developed as a software package to run on a home computer. But since the software is developed in Java, it runs very well on a laptop computer too. The only issue has been the need to have an internal high performance soundcard. We could not find a decent USB soundcard that would have the performance to match the MDSR requirements. That is when David Ring approached us and he provided the answer to a USB sound card that we thought will work.

The MDSR team has developed a potable BiLIF and USB sound card combination that allows using the MDSR for portable operations with a Laptop. The design is based on a existing high end USB sound card - the ASUS Xonar U7. This sound device provides a 8pin header plug for the connection between the BiLIF and the soundcard PCB. This makes the adaption of the U7 very simple and robust.

We have just finished the compliance test of the portable Bi-LIF - Asus U7 unit. The performance matches the one we measured during the Asus Xonar test. The Asus Xonar is a PCI-E card with a very impressive dynamic range.
Now that we have the portable BiLIF running on a Laptop it can basically go anywhere and provide superior RX and TX audio as well as all the digital formats provided by fldigi.

For more info go the MDSR website:
http://users.skynet.be/myspace/mdsr

or the MDSR Yahoo user group: (photos can be found at the Yahoo user group)
https://groups.yahoo.com/neo/groups/mdsradio/info
https://groups.yahoo.com/neo/groups/mdsradio/info

Comments are always welcome.
All the best and 73;

The MDSR Team

# 21087. 706 frozen

Hi, my IC706mk2g seems deep frozen. On power-up it displays a full-scale bar graph, no audio and no transmit on PTT.All other functions seem to be OK, e.g. VFOs, mode switch and all menu switches. Remember this happened a few times earlier, then returning to OK status, but now problem is permanent. Any clues to this?

Do a full CPU reset.
Hold Band up
Band down
And Power at same time then release at same time.

Kent, I had this problem too. From what I found out it is likely a dirty connection inside the HPF unit. I sent mine out to get repaired as I didn't want any oops's with this particular radio.

# 21095. Repairs

Yahoo group: ic706 (2010 — 2015)
Date: 2014-05-13 08:36:23 UTC
From: Michael Buckley
Topic: 6764  Message: 21095

I just thought the others might like to benefit from my experience.

I have a Mk 1 and the AAMU, however they would not work together,
although each worked perfectly well in themselves.

Being fairly local to Martin Lynch who are always so very helpful, I
took it in there and they said, looks like a board problem in the set
and we don't have spares, sorry!

I gave Icom in Herne Bay a ring and Chris there said, yes, no problem,
bring it in, on an agreed date, be there at "first parade" and we will
see what we can do.

So I did and with a bit of bribery to the XYL had a day out in Reculver
as well.

Wonderful service, by noon all fixed - oh! and did you know somebody has
blown the front end of the 2M section, that is why its deaf!
(Seems that putting straight RF into it does not do it much good, so
that was how I bought it, it seems, s/h of course)

I have to say I recommend a trip, by arrangement, down to Herne Bay,
good advice, delivered in a helpful way and with a sensible price tag.
(Two silly little components needed replacing.

Andy AB6UX

# 21100. IC-706MKIIG Deaf RX, TX works OK

Yahoo group: ic706 (2010 — 2015)
Date: 2014-05-15 20:12:04 UTC
From: abvasquez@...
Topic: 21100  Message: 21100

I was driving one day and the RX suddenly went quite while listening on 20M. Checked all the bands and it's pretty much dead. I could only hear faintly strong signals that are likely S9+. Plugging and unplugging the antenna does not change the white noise ratio. I've read about possible issue with RL1 having the antenna connected to PA output all the time due to a shorted Q1. Is there a quick way of verifying this condition before doing any surgery on the board and any other possible cause and cure encountered by anybody? Your assistance would be greatly appreciated. Thanks!

# 21105. MDSR (modulation demodulation software radio) goes portable

Yahoo group: ic706 (2010 — 2015)
Date: 2014-05-20 18:04:27 UTC
From: alexschwarz237@...
Topic: 21105  Message: 21105

Hi Everybody;

The MDSR and the BiLIF hardware gives HAM radio operators to upgrade their analog radios to an IF SDR. The MDSR software V2.8 can be downloaded from our group or the MDSR website.

for more information please join our group:
https://groups.yahoo.com/neo/groups/mdsradio/info
https://groups.yahoo.com/neo/groups/mdsradio/info
MDSR website: http://users.skynet.be/myspace/mdsr http://users.skynet.be/myspace/mdsr

We have just finished testing the MDSR software running on a Asus T100 notebook touch tablet computer. The notebook is connected to the BiLIF - USB Xonar sound device via USB port. As a test radio we used the IC-7000 and it performed beautiful.
The T100 touch note book is a great little device that has the power to run The MDSR software with room to spare. The 10" screen is a bit small but makes for a great portable unit. It provides 10h battery time, with the connected peripherals it will be more likely 5h, but connected to the FT-817 it is great for JT-65 and WSPR contacts while portable. And it is light; about 2lb!
This T100 sells with full capable Win8.1 and has 64GB of solid state hard drive which is more than enough for the MDSR software and all the companion software. At a price point of below $400 it is a steal.
Please note: The MS Surface touch pads are Win8.1 RT which does not support legacy programs and can not be used for MDSR.

The MDSR software is free and RX kits can be ordered via Paypal. For the RX - TX kit please contact me directly. My e-mail can be found at my VE7DXW profile at http://www.qrz.com/ http://www.qrz.com/ or in the group.

All the best;

Alex / VE7DXW

# 21106. Re: MDSR (modulation demodulation software radio) goes portable

Yahoo group: ic706 (2010 — 2015)

From: qrv@kd4e.com
Topic: 21105  Message: 21106

Am I correct in reading-in that MDSR and BiLIF are limited to the
proprietary and problem-plagued Microsoft operating system?

If so, are there any plans to port it to the non-proprietary and
open source Linux operating system?

Thanks - David KD4E

# 21109. 706G with no RF out

Yahoo group: ic706 (2010 — 2015)
Date: 2014-06-13 02:25:15 UTC
From: Wayne Bowyer
Topic: 21109  Message: 21109

Today my 706MKIIG showed no rf out on any band--HF thru VHF/HUF. It's a mobile install and was working fine just the day before. I was able to key a nearby 2m machine and got a weak signal report making me think I just had driver output (no relative output on rig's meter) I've not had the chance today to pull it out and look further, so this is a pretty much general inquiry as to a good starting point. Hopefully since the problem is on all bands that might narrow the search. Any input would be most appreciated. The rig is an early serial # G and is about 13-14 yrs old.

If rf out is the only symptom, I'd look for operator error as its rare that both antenna jack systems fail at the same time.

Look at the internal fuse. I don't have my drawings handy but I think the fuse is on the high current rail.

Thanks for the replies fellas. As best I can tell it's not op error, I've had this rig since new and am pretty familiar with it's operation. But I was remembering something about an internal fuse on the rf deck. I'm thinking that might (hopefully) be my problem.

I think that fuse is a 4A one. Hope it's something simple.

First thing is to check output on FM with a watt meter.

Tried the rig today and it worked as it should. Full output on all bands. I will plan to pull the rig out of my truck and go thru the radio. Must be something loose or possibly a poor connection in the power plug which I understand is problematic. Actually I know it is as it was very touchy when just sitting on my desk. I really appreciate all the replies!

Have you checked the power supply/connections supplying power to the rig when it was acting "touchy?"

Today my 706MKIIG showed no rf out on any band--HF thru VHF/HUF. It's a mobile install and was working fine just the day before. I was able to key a nearby 2m machine and got a weak signal report making me think I just had driver output (no relative output on rig's meter)? I've not had the chance today to pull it out and look further, so this is a pretty much general inquiry as to a good starting point. Hopefully since the problem is on all bands that might narrow the search. Any input would be most appreciated. The rig is an early serial # G and is about 13-14 yrs old.

If the power cord is not icom, that may contribute. I have read that while it looks like molex, and vendors sell molex lookalikes at hamfests, the molex pins do not reliably mate with the icom connector.

From: dcannonfire@...
Topic: 21121  Message: 21121

Hi all,

First off, if this question has already been asked and answered, then my apologies. I've searched this group and missed the post if it's been discussed.

I want to run a digital sound card circuit with my Gen 1 ICOM 706 for PSK-31 operations. I'm primarily a MAC guy (writing this on my iMac in the shack next to my rig while my iPad decodes PSK-31 on 20M). Eventually I'd like to try automated operations using MacLogger DX, however my immediate interest is PSK-31.

Anyone here set up to run PSK-31 with a Mac now and have some practical experience / advice they'd like to share?

What interface are you using and why do you like it?

Which software set are you using and what features made it your choice?

Thanks in advance
!

Power Amplifier. In this case similar to gold dust if the Motorola version.

When icom had them, they were pricey indeed.

Yeah, amplifies is correct. Poor choice of words on my part. I guess I need to have my English and literature teaching daughter school her old man. :)

On the same note--I just pulled my 14 yr old 706G out of my truck and it will go back to my operating desk. I realize the PA devices are "unobtanium" so I want to be as easy as I can on this older rig. No more bouncing around and extreme temps.

I wasn't trying to hassle you. I just didn't want someone like the OP to get poor information and repeat it to someone else, etc. Not knowing what a PA is, indicates to me he's a newbie and was going to take the response as a bit of a definition. :o)

HI all ..... two things.
1- I want to get the best performance possible out of my 706MII on CW. Any thing I can do to optimize it? Other than adding more filters ( have the narrow already).

2-I got nothing on 6m. No xmit and as far as I can tell no rx. Antenna is hooked up to the HF/6m connector, but I got nothing on 6m. Fine everywhere else 2m, HF but no 6m.

Any ideas on that?

Thanks,

Matt

The 706 will power up "on" if it thinks that was the state when power was removed. I have a mk2g that wouldnt reliably power on so I soldered across the power relay contacts. That means the display will work at all times although the power switch still needs to operate to make the radio wake up.

you can diagnose from there, but first check would be to clean the front panel to radio connections and try with the panel attached to radio directly

I'd have a look a clicking relay posts on this Group. A friend of mine just fixed a similar fault.

You could have well blown the pcb track as described that runs under the rubber pads which are glued to the Main Board. The glue used on earlier versions was reacting with the pcb and set up corrosion.

If you have a look at the circuit you would be able to check if the microprocessor is switching on the relay.

From: skyjeepaviation@...
Topic: 21138  Message: 21145

there is no update for software - just firmware, you have to replace the processor chip. The only thing you can do is a reset which clears all the settings and memory back to factory. No backup battery to replace either.

clean the control head contacts. If its a 706 mk2g, you are likely to do better by parting it out.

# 21146. Retaining Clip for MKII Head

Yahoo group: ic706 (2010 — 2015)

From: n3lka@...
Topic: 21146  Message: 21146

I recently had either a stupid or dishonest buyer from ebay return a 706MKII back to me, claiming it wasn't as described. Anyway, he shipped it back with the retaining clip missing from the head. I ordered the parts to repair it myself, but is there supposed to be a small nipple coming up from the area where the spring contacts against the head? If there's supposed to be one, he obviously busted that off as well. I swear the guy bought the radio and then swapped heads on me.

Also the AF gain pot was bent, so I have to replace that as well. Ebay of course sided with this idiot.

# 21148. Help with low talk power on SSB?

Yahoo group: ic706 (2010 — 2015)
Date: 2014-08-03 05:35:59 UTC
From: Matthew Poertner
Topic: 21148  Message: 21148

Hello, pretty new to ham radio and very new to the IC-706MKIIG. This radio was given to me by my old boss. It was his dads radio. I know nothing else about its history.

I've made some contacts a few months ago. I'm in California and the furthest contact I've made was Kentucky. I haven't touched it for a few months just been too busy with work. Then my brother in Arizona got his ham ticket.

Trying to keep it short - My brother can not hear me on SSB. CW he can. I noticed then on the SWR meter that SSB the needle goes to about 20 watts while on CW it's a full 100. checked the mic gain doesnt matter. Between 6-10 same results. Then I moved my mic from the front jack to the back and when Ikey up I get all sorts of static, not even saying anything. Weird. Any ideas?? I'd really love to be able to talk to my brother on the air.

Much appreciated!

From: Joe
Topic: 21148  Message: 21149

My first thought would be a bad mike connector, cable or mike itself. Moving the mike to the back of the radio would put strain on the mike cable where it goes into the connector. This would be a good place to start before you start looking at the internals of the radio.

From: n4dou@...
Topic: 21138  Message: 21150

I had the same problem. I found that the power cable and rig connector pins had become dirty and I cleaned them with a Q Tip and rubbing alcohol. Also, I found that the male pins in the connector (on the 706) and the female pins in the connector ( in the power cable) were not making good physical contact, so I used a small screwdriver to spread the male contacts and to narrow the female contacts. I was very happy when the rig powered up.

I hope this helps.

# 21151. Another Power Problem

Yahoo group: ic706 (2010 — 2015)
Date: 2014-08-03 13:34:19 UTC
From: Joe
Topic: 21138  Message: 21151

I'm getting ready to help a friend use his 706MKIIG for a remote base application and discovered a problem. I can turn the radio on, then turn the radio off, but after that I cannot get the radio to turn back on again. Disconnecting and reconnecting the radio from the power source allows it to be turned back on and off again, but then it will not turn on again.

I tried searching the email archive, but YahooGroups is driving me crazy with their "new and improved" format. Searching is a nightmare.

Thanks, 73, Joe, K1ike

There is a gentleman named Scott Malcolm who lives in Washington State. He

does repair work on Icom. My 706 MKIIIG went down and he repaired it.
Very reasonable price and he will likely answer your questions in the event
he doesn't think anything is wrong. Very sharp individual.

Hi All

I have also request from my side for your advise to improvw audio or mic gain. I get full powee output.But even if I keep mic gain at 10, mu alc meter read zero. But if I switch on xompressor, alc read within alx zone, keeping my comp level pot at max.
Does this mean my audio gain is less? Cam u advise me to correct it?
In my 746 pro I keep moc gain at half level only.

Please send ur sugessions.

Hi
As a first step, clean the male and female connector between radio base and front panel.
Rds.
Second try: keep the radio on for longer time or warm the radio using hair dryer or sun light.

CW is a "constant carrier" mode, whereas single-side band is not.? You will see full power output when in SSB mode only on carrier "peaks" which are intermittent, rising and falling with the inflections of your voice if you are driving it by speaking into the mic.

Unless you have an external, true active "peak-reading" watt meter (e.g., Ameritron AWM-30) connected between the 706 and the antenna or tuner, you may not see the full power output on the internal power output meter on voice SSB.? You might try making sure the internal meter display is set to "PO" (power out, or power output), and they try a sharp "whistle" into the mic while in SSB mode.? Probably ought to do this into a dummy load and not on the air, unless you are

Most watt meters are only "average reading" wattmeters and will show full power out only in a constant carrier mode such as CW or FM.? AM may, but most rigs limit AM output to 25 percent of rated power.

Also, go into the Quick Set menu and make sure full power out (H) is selected.

I left the radio on all night and now it works just fine. It had been off the air quite some time before I tried to turn it on, maybe moisture from the summer air got into the rig. Oh well, I'll make a note of the problem and move on.

The MKII-G tuner button is orange anytime an automatic tuner is not in use. It will blink red while an outboard auto tuner looks for a match and shows solid red when the auto tuner is satisfied. Solid red indicates outboard auto tuner is activated. AFIK, the tuner call button only has a red light, unlike the preamp/attenuate button that has both red and green since it offers two functions.

# 21165. MDSR (Modulation Demodulation Software Radio) is testing JT-65

Yahoo group: ic706 (2010 — 2015)
Date: 2014-08-20 22:06:19 UTC
From: alexschwarz237@...
Topic: 21165  Message: 21165

Hi Everybody;

We are currently testing the JT-65 mode on 30m (10.138Mhz), 20m (14.076MHz), 17 (18.102MHz) and 15m (21.076MHz). The frequency band chosen depends on the time of day and when band openings occur.
Frequencies will be announced in the Yahoo user group.
https://groups.yahoo.com/neo/groups/mdsradio/info
https://groups.yahoo.com/neo/groups/mdsradio/info

If you have JT-65 capability, please help us to make as many contacts as possible. The call sign that is being used is VE7DXW. If you do not have JT-65 available but would like to have it, please send us a message and we can help to get you set up with software and audio connections to your radio.
JT-65 is a great mode to get contacts worldwide with QRP operation. A standard wire dipole or a GV5RV antenna is more than enough to cover the planet.

The log-book will be also displayed on the MDSR home page of the MDSR Demodulator-Modulator Software Radio:
http://users.skynet.be/myspace/mdsr/ http://users.skynet.be/myspace/mdsr/

The MDSR station will operate with the VE7DXW call sign and is operated out of Vancouver, Canada. The output power is 20W and all contacts will be logged on QRZ.com. On JT-65 worldwide contacts are possible any time a band opens up. In the last few days we made QSOs into USA, Canada, Ukraine, Netherlands, Poland, Kazakhstan, Argentina, Brazil and many more.

Thanks for your help and see you on the bands! 73 and good DX...

The MDSR Team
Alex Schwarz

From: wa7dxz@...
Topic: 21166  Message: 21166

I have a 706 Mk II G, great radio, I use it mostly as a back up, and recently decided to store some 2M repeater freq's in it.
I cannot figure out how to store the tones. I have the repeater freq in, it is in FM mode, I go to Q6, and choose a tone, 162.5,,, and now what? I can't figure out how to "save it".
I also do not see the FM-T sign on the display.
I have read the manual, it is so confusing. Can someone take me through this step by step?

Why dont I see the FM-T display, and once I get to the tone I want,,, how do I "save it" to the radio?

From: steve schumm
Topic: 21166  Message: 21167

Hi Bob- You have the freq. set up. Go to M4, set the ton button to read t or t-sql, your preference to its use. Then go to Q6, set your tone freq. Go back to M2, press the MW button, it will beep putting in the tone.. Good luck and keep us posted. 73-Steve PS- If you are on a repeater freq. in memory and turn the main tuning dial it will move the freq you have stored and turn off the PL and offset. To stop this from happening use the lock button. To restore the offset and tone, etc. Just push the M/V button twice and your back...

# 21168. 2m Transmit and Receive Problem

Yahoo group: ic706 (2010 — 2015)
Date: 2014-08-27 10:59:19 UTC
From: Todd Lee
Topic: 21168  Message: 21168

I've had great performance operating mobile with my 706Mk2G for 3 years on VHF and HF. Last night I lost receive and transmit on 2m. I took the rig out and did some checking with a dummy load and another antenna.

I have very low output on 2m in all modes. I can hear the rig with handheld close by. Transmit audio seems clear into the handheld.
I have very poor receive on 2m. I can't hear local repeaters. I can hear my handheld when close.

All other bands have full output - UHF and HF. Receive is also fine on other bands. The issue seems limited to the 2m band.
Did the CPU reset and nothing changed.

I would like to try and fix or have repaired. Any advice appreciated.

Sounds like it could be a simple thing like a bad solder/broken connection between the PCB and antenna jack.  This can happen over time.  That'd be the first thing I'd check.

# 21171. Update on MKII with no 6m rx/tx

Yahoo group: ic706 (2010 — 2015)
Date: 2014-08-27 20:10:15 UTC
From: Lizooki@...
Topic: 21171  Message: 21171

A few weeks ago I asked about a problem with my MKII not doing anything on 6m ..... I finally ( and accidentally ) figured it out.
Apparently, a top quality hf low pass filter ( new TV's, not matter how expensive , are CHEEP!) used to stop tvi and keep the family happy will also stop 50.000mhz.

I had my MKII hooked up to a different tuner a couple of days ago, bypassing the filter and ... VIOLA! I have 6m!

Laughing at myself.

Matt

I thought about that also but he said UHF works fine. Could be a solder joint further in though.
I wonder about a 2m filter if their is one.

the model is prone to burning out the pin diode in the VHF section

if you want to trace this yourself it can be done (carefully) using a small lamp such as 'grain of wheat' type touch onto the points of interest

# 21179. MDSR releases the paper published in the TAPR 2014 annual magazine

Yahoo group: ic706 (2010 — 2015)
Date: 2014-09-22 17:23:18 UTC
From: alexschwarz237@...
Topic: 21179  Message: 21179

Hi Everybody;

This year as well as the 4 years previous the MDSR Team has published the continued development of the MDSR software and the RX/TX Bi-LIF hardware that can adapt to almost any symmetric HF transceiver (FT-817, FT-857, FT-897, FT-950, IC-703, IC-906 IC-7000, IC7200, IC-756, TS-2000) With a simple down-converter PCB (LIF2014 – RX only) and your computer soundcard or on board sound device all the listed transceivers and many others can be turned into IF-SDRs. This also allows the use of 3rd. party software like fldigi, JT-65-HF and many more; as explained in the publication and in the manual.
The MDSR development also provides an additional up-converter PCB that can turn the listed transceivers into full RX-TX IF-SDRs where all the modulation and demodulation are performed in the computer. For the TX version please contact alexschwarz@telus.net mailto:alexschwarz@telus.net directly.
To order the RX kit: http://users.skynet.be/myspace/mdsr/order.htm
http://users.skynet.be/myspace/mdsr/order.htm

This years document deals with the continued development of the MDSR software V2.8 and the use of USB port external sound devices. The external sound cards are also used to build a portable and mobile MDSR SDR system.
Download the PDF document:
http://www3.telus.net/public/bc237/MDSR/TAPR2014.pdf
http://www3.telus.net/public/bc237/MDSR/TAPR2014.pdf

For more information and to download the MDSR V2.8 software, go to:
http://users.skynet.be/myspace/mdsr

…or our Yahoo MDSR user group:
https://groups.yahoo.com/neo/groups/mdsradio/info
https://groups.yahoo.com/neo/groups/mdsradio/info

The MDSR and the BiLIF development will give your existing radio a performance boost and extend the capabilities of the transceiver into the digital modes!
The MDSR download also includes easy to follow manuals in PDF format which are also available separately on the group or website.

Thank you and 73

The MDSR Team

# 21180. Data mode failure

Yahoo group: ic706 (2010 — 2015)

From: <premanpulikkal@...>
Topic: 21180  Message: 21180

Hi All,

I was using data mode (psk) thru HRD in my radio. I was using both ACC1 as well as data jack for this and both was functioning well. I use my home made civ as well as sound card interface.

But now in both cases, my data transmit not coming. I am able to receive and decode psk signal. When transmit in DM780, sending sound comes thru speakers. Radio switch to TX mode. But no signal goes out and power meter read zero. I have selected data mode.

Please advise me how to rectify this issue. I use core i3 laptop running win 8.1.

Check the following in HRD/DM-780:

1. What "sound card" is selected for HRD/DM-780 to use;

2. What you have selected in "PTT" in the DM-780 options menu to key the rig.

Also, swap-out your "home made" CI-V interface cable and sound card interface with known good devices to eliminate those two as a problem; do one at a time, so you will know what is the problem.

# 21183. ON/OFF problem

Yahoo group: ic706 (2010 — 2015)
Date: 2014-09-26 14:07:34 UTC
From: Joe
Topic: 21180  Message: 21183

I have my friends 706MKII here and I'm getting ready to set it up as a remote base. I'm having a problem turning the radio on after it has been in an ON/OFF sequence. When I connect the radio to power I am able to turn the radio on and off. Then when I go to turn it on again it will not turn on. I have to remove the power cord and reinstall it, then the same thing happens again.

Has anyone see this problem before? I also noticed that the back of the radio is warm after it has sat with the power cable connected but has been turned off overnight.

Hi Rhys,

Thanks for response.

after spending some time on trouble shooting, I am now able to get data working thru ACC1 jack. The expected problem was some loose connection between signal from pc to radio. Now I checked the psk signal from pc audio out pass thru my interface and reach till the tip of data pin . but when I insert the data pin to radio and try transmit from DM780, psk signal not transmitting. any possible damage to the circuitry inside radio? else any setting in radio went wrong? please advise.

Hi

I had a similar issue with my MK II G. First remove the front panel from the radio base and then clean the gold plated make -female connectors using rubber eraser or paper. It was given for me the fault rectified this way. "The radio getting warm even during switch off " will be advised by some of our electronics specialists in the group :)

# 21186. IC-706 Problem

Yahoo group: ic706 (2010 — 2015)
Date: 2014-09-28 17:09:17 UTC
From: Rich Bauer
Topic: 21186  Message: 21186

greetings, new list member here.

I have the IC-706 MKIIg and it has served me well for many years. today while preparing for a camping trip I discovered that it is not keying up the local repeater (WCRA 145.31/- 107.2). troubleshooting with my handheld I determined:

- the 706 IS transmitting a signal on the input frequency
- I have triple checked the tone frequency
- my swr/pwr meter shows SWR less than 1.5:1 and full power out
- the 706 will receive a signal from the repeater
- I can access other area repeaters...just not 145.31
- the repeater is functioning as I can access it with the HH
- I am located maybe 1-air mile from the receiver and can access it from my HH and other mobiles.

I have re-set the CPU...twice...with the same result. this is very bizzare. any suggestions for further troubleshooting or a solution?

Check to see if the memory slot for that repeater got set to "narrow FM." That happened to me and took a while to figure out. That repeater just would not respond to a narrow FM TX.

# 21190. IC-706 issue with top cover/speaker wire in contact w/ribbon cable

Yahoo group: ic706 (2010 — 2015)
Date: 2014-09-29 14:07:39 UTC
From: dhobson123@...
Topic: 21190  Message: 21190

GM,

Just wondering if anyone else on the list has had this issue with an ic-706.

Details: ic-706 had been in perfect in operation for more than 10 years in the truck...recently top cover opened to verify if the UT-86 option module was installed. Noticed after opening top cover that there is a black pad that isolated or pads the top cover from the ribbon cable below it and that it had been so many years since the top cover was off stuck to the lid thus pulling out the ribbon cable from the socket. Easy enough installed the ribbon cable back in proper position in the slot and put top cover back on. Seemed after that the ic-706 didn't want to tx properly to local repeaters, would work sometimes then if you moved the rig or pushed on the top cover it would work then not work....have tried several times and it depends where the speaker wire lays against the top cover and or the ribbon cable below it that it will work or not work properly.....seems to work fine with no cover on or the speaker wire placed out of the way. So not issues when cover is off, none at all but minute you place cover on then starts acting up.

Has anyone else on the list had this issue? And if so how did you resolve it?

Below link to simple picture of the top of the ic-706 and reference of ribbon cable where the speaker wire would run across once the top cover w/speaker is put back in place (picture uploaded to this groups 'Photo' area).

Those ribbon cables may have a little play from left to right. Look carefully, you may need a magnifying glass, to make sure the pins are matching the connections on the ribbon cable, you might need to move it a little bit to the left or right to get them exactly matched up. If it's slightly off it may not be making a good connection on all the pins all the time.

At least that's what's happened to me before.

# 21195. Convert IC-706S to American UHF

Yahoo group: ic706 (2010 — 2015)
Date: 2014-10-02 19:50:07 UTC
From: lavinjj.tx63@...
Topic: 21195  Message: 21195

I picked up an old IC-706S at a local hamfest and noticed that the UHF frequency range on it goes from 144Mhz to 146Mhz and then stops. I've been looking around the Internet to see if there may be a mod to allow use up to 148Mhz so I can access some of the local repeaters here in Texas, but have been unable to find one that seems to be for the IC-706S.

Can anybody help me?

Thanks

KF5SVR

# 21196. RE: [ic706] Convert IC-706S to American UHF

From: Bob Reiff
Topic: 21195  Message: 21196

Looking for a VHF mod will find more results for 144-146 MHz. UHF is up around 440 which the original 706's can't do at all. I am not even sure what a 706S is.

As you may know by now that is a European version of the IC-706. Never heard of the "S" model designation, however, and I have two 706s, the first since 2000.

I remember reading that some of the ham radios built for use in Japan were hardwired to only go from 144 to 146. Maybe the 706S is a unit built for use in Japan?? From what I read they may not be modifiable without changing the main microprocessor.

When I read that, though, it may have been about some brand or model other than the Icom IC706.

Does this mean that the common "MARS Mod" won't work on this radio?

OK, so the IC-706S was never distributed in the US? That must be why I can find no reference to it anywhere online.

At 10 watts, even if that "rare" IC-706S could be modified to expand VHF coverage to 148 MHz, hopefully those repeaters would be close by!

(Of course, I have an original IC-706 (no MK) that only output 10 watts on VHF, and it is my main shack VHF unit; transmitting into a good, high-gain Diamond vertical (X-200A) up 30 feet, it does the job on area repeaters even in the mountains of SW North Carolina and North Georgia!)

They guy I bought it from did say he picked it up in Japan, which probably means that it might be hard wired for a specific range. If I can't mod it to get the full 2m range it really isn't that big of a deal, I really bought it for the HF QRP side of things since he also said it was also limited to only 10W output.

I just figured I might get away with using it for 2m as well, if not it's no big deal.

Thanks all,

Jim KF5SVR

It will likely work if you can figure out the correct arrangement of diodes in the programming matrix for USA use. Often in typical mods you only have to **REMOVE** diodes. In this case you may have to **ADD** some . They are typically SMT technology so you might have trouble finding what you need if you can’t remove one and remount it elsewhere.

You might try the polishing compound used to polish the haze out of headlights. Toothpaste will work as well.

I'll take a guess the band setup row of diodes is similar to the IC706 (original)

there is a row of diode packages on the top side of the main board, labeled D60, D59, D58, D57, D72

You need to remove D60 and D59 if present
D58 is for Europe, D57 France

Hi All My old 706 has been good to me, it has a very low serial number. For the last 2 years i have had it mounted in my car. The main unit is bolted under the rear deck, and the head mounted on a goose neck in the front. Last summer i noticed the receive would drop out, and it would only receive very strong signals. A momentary push of the mic button would bring it back to normal. I loosened and tightened all the board screws none were loose. I did find the screws holding the so239 were loose. I reinstalled it, the rig worked fine. last night on my way home from work. I picked up the mic to try to contact a dx station. When i released the ptt button, it stayed in transmit. the red light stayed on. then after a few seconds it started to receive again. I tried another mic both on the head and on the main unit with the same results. seems like a sticking relay.

Can someone point me in a direction to check? I have the factory paper service manual.

By the sounds of it your TR relay is acting up with momentary pushing thePTT. You may have developed a bad ground somewhere that is letting RF into the radio keeping it keyed up, exp with a remote head set up. If the TR relay was mechanically stuck in transmit the TX LED would not stay on. Dave, VE1DAY

Hi Dave- I have a 10 watt tune module. it is after market. it is a little gizmo that plugs into the back plug where the connection is for their tuner. I just push the tune button to activate. In the startup mode, is when you push the power button and lock button at the same time to bring the start functions.. Go to  #27 ""A-TUNE STRT"" this has to be turned on to work the module.. Keep us posted---Steve--WB2OEE

Tune modules were aftermarket items designed to fool the radio. They were between 10 and 30 dollars in the 90's. What exactly do you have? There are many, many plans online for building your own out of junk box parts.

Kurt

Thanks for the reply group. I will give that a shot this weekend.

I am thinking of picking up one of those LDG autotuners and looking at either a generic tuner and using the tune control module or the specific IT-100 model for Icom radios, I should test out the module beforehand if I go the generic route.

The DX Engineering website has a "documentation sheet" for the Better RF 706 tune module available here:
http://www.dxengineering.com/parts/btf-706tune/documentation

Looks like it's on a par with the AH-4 "manual" as far as "detail!"

I picked up a cable for my LDG Z100Plus tuner. Plugs into the radio's tuner port, and the control jack on the back of the LDG tuner. Once I turned on the ATune Start option (there are several settings, btw), I can hit the Tune button on the radio and it Just Works. The cable also provides power for the tuner from the radio, so it's one less thing to plug in. I paid $10 or $15 from my local ham dealer (B&H Sales in Derby, Ks, http://hamradiocenter.biz ). It's a Radio Shack franchise, specializing in ham radio. If you're interested, give them a call and I'm sure they'd ship one to you. If not, I can (cost+shipping).

I believe most or all LDG tuners are capable of interfacing. Most find that tuner module more of a pain than a help because key up time is too short.

You can adjust the TX time of those "plug-on" tuner modules by adjust the value of the capacitor in the circuit.

# 21221. MDSR uses Notched noise to test transmitter performance

Yahoo group: ic706 (2010 — 2015)
Date: 2014-10-18 02:51:54 UTC
From: alexschwarz237@...
Topic: 21221  Message: 21221

Hi Everybody;

MDSR is the software that let you get SDR performance out of your analog RIG. To see how go to our website - see below.

Adam Farson (VA7OJ) uses a -90dB notch to test the performance of receivers in a test called NPR (noise power ratio). I personally believe it is the best way to test a receiver regardless if it is an SDR or a conventional receiver. Unfortunately a -90dB noise notch with 3kHz bandwidth is very difficult to reproduce. Up to date there is no digital test unit that can do it and we have to use old satellite test equipment with fixed frequencies. But notched noise has also very interesting test applications for testing the performance of transmitters. The MDSR team has introduced notch filters into the new version of their software (V2.9 Beta). This worked so well that we also decided to use notch filters with white noise on the TX side and see what performance one can get with a 24Bit sound card and the BiLIF up-converter. Although the performance did not come close to the NPR test notch of -90dB the team managed to get a -65dB notch at the output of the BiLiF IF port. The measurement shows the notch output at 14.100MHz for the FT-950 transceiver driven by the BiLiF for 5W and 50W (60W is the max capability for the test set used; HP-8921A). What is noticeable about the measurements is the degradation of the notch depth with higher output power. A higher output produces more IMD (intermod) and fills up the notch with noise. This is a very useful test if you are interested in finding the IMD issues in your transceiver.

For more information please join the MDSR Group;
https://groups.yahoo.com/neo/groups/mdsradio/info
https://groups.yahoo.com/neo/groups/mdsradio/info

..or check out our website at:
http://users.skynet.be/myspace/mdsr http://users.skynet.be/myspace/mdsr

All the best and please download the V2.9 Beta. It is free for amateur radio use. Available from the group only.

The MDSR Team

# 21222. Re: [ic706] Better RF tune module IC-706

I have one on each of my IC-706MkiiiGs.

You just push the tune button and it sends out a 10 watt CW carrier for about 40 seconds. This gives you time to adjust your antenna tuner, your screwdriver antenna, let your automatic tuner do its tuning, or check your SWR. When you get done you can push the button again and it will stop sending out the carrier. Push it one more time and it will be ready to push again for tuning. If you do not push the button the second time, it times out after about the 40 seconds that I mentioned and stops sending out the carrier on its own. You then need to push the button again and it will be ready for a single push the next time you need the 10 watt CW carrier. If the 40 seconds is not long enough then you can just push the button twice again and it will send out the CW carrier for another 40 seconds.

I find this very very handy for tuning my antennas. It's different than the ones with just the resistor and capacitor as you can shut it off whenever you want, and 40 seconds is usually plenty of time to tune what you need to tune.

Stanley Klakamp wrote (referring to the Better RF 706 Tune Module) "It's different than the ones with just the resistor and capacitor as you can shut it off whenever you want ..."

I have one of the "resistor and capacitor" type tuning modules and it can, indeed, be stopped anytime the operator wants by just momentarily pressing the tune button on the rig.

Not saying that all such modules allow that, but the Better Tune RF module is not unique in that aspect of operation.

I picked up a 706m2g that I only listen to until today when I discovered that the SWR jumps up on its own and the tuner on these two bands goes crazy. I tried my other 706 and my 7000 and there's no problem. I also tried a different antenna an the same result takes place. I reset the CPU and checked the SWR of both antennas nothing helped. Can anyone point me in the right direction. Thanks

I would suggest its not a swr problem but a known oscillation problem.

The first thing to try is poping the covers and tighten all circuit board mounting/grounding screws. If your lucky that will solve it. Also check the little spring tabs that provide grounding.

There are a few mods out there. I remember one guy extending his coax length with success.

One thing you may want to look at is a known grounding problem. If using the remote mounting of the head, make sure you use the screw for the remote cable.

Another grounding problem has to do with an internal grounding problem. Make sure all the screws that hold the boards down are tight. Also I read somewhere on teh internet about an internal clip or clamp but don't know the specifics so you will have to search for that.

Ditto with my "original" IC-706, except it's never been mobile, but just keeps plugging along.

I use it in the shack as a back-up HF rig, and for VHF to access local repeaters.

One "short-coming" of the initial series was that it output only 10 watts on 2 meters, which was bumped up to 20 watts in the IC-706MKII, and (I think) 50 watts in the IC-706MKIIG, along with UHF capability as well (at a lesser output). I use an amp with it when I need to reach out farther on VHF simplex.

Each series has its design quirks, which are easily overcome. There are some problems that crop up from time to time common to the entire series, such as the grounding issue addressed in a current thread on this list, but not necessarily anything inherent to only the original 706 that I am aware of.

Of course, parts for all models will become scarcer as times goes on, particularly the output transistors in the PA section.

Many rigs have there own minor to major problems that may not show up in all of them,but a good number.

I have the 706mk2g and had to send it off as it would not come on. Seems there is a capacitor that leaks and eats up the circuit board traces. Not all 706s will do this, just enough to be a know common problem. My 746pro had the famous dial light fail. I replaced a transistor that cured that as described on the internet.

# 21234. Re: [ic706] Better RF tune module IC-706

Yahoo group: ic706 (2010 — 2015)
Date: 2014-10-20 17:51:34 UTC
From: Dave
Topic: 21212  Message: 21234

Thanks all for the information. I wasnt having much luck with the module. What was happening was it would key the radio in CW for a while and then any time I tried for a second time it would flash the tune button and not key up. This is an origional 706 so I am aware of it not working on six meters. To cut a long story short, I picked up an LDG Z-100 at the recent fleamarket. After making an interface cable it now works perfectly. The only quirk is If I need to use the autotuner on six then you have to use the button on the tuner. Dave, VE1DAY Sent from Samsung Mobile

Dave VE1DAY wrote: " ...I tried for a second time it would flash the tune button and not key up." Perhaps the Better RF Tune module won't TX a second time if a tuning solution was reached the first time? If not that, then perhaps one of the internal components has failed or is out of spec. Dave VE1DAY wrote: "The only quirk is If I need to use the autotuner on six then you have to use the button on the tuner." The reason that the IC-706 (original) will not command your LDG to tune on 6 meters is because the microprocessor and/or firmware in the IC-706 did not have the commands to control the ICOM line of external autotuners (e.g., AH-4) or any third-party autotuner that emulates the AH-4 on 6 meters. This "quirk" as you call it was corrected in the IC-706MKII and IC-706MKIIG which will command tuning on 6 meters. Dave VE1DAY wrote: "This is an origional 706 so I am aware of it not working on six meters." The IC-706 itself is 6 meter capable. Larry J. Topic: 21212  Message: 21236

Good point Larry, the microprocessor may have known there was a match. That being said, I picked up an LDG Z-100 plus and tried that twice, it worked no problem for the second time with the tune button on the radio.

Problem solved as I no longer use the module now I have a new (to me) auto tuner.

Thanks again.
Dave

My Icom 706 mk1 has the following issue:

it started freezing so i reset it as described in the manual and now it wont turn on anymore just the fan spins and you can hear the relays clicking...

has anyone had this issue before?

David

Last time this happened to me, I removed and re-seated
the front panel. Contacts had gotten cruddy.

# 21239. Stuck TX when external speaker connected.

Yahoo group: ic706 (2010 — 2015)

From: Matthew Poertner
Topic: 21239  Message: 21239

I use an external speaker because I find the internal speaker hard to hear considering its facing upwards. Anyway, the other day I was trying out a different radio. When I hooked the IC-706MKIIG back up it was stuck on transmit. I traced it back to the external speaker connection. When I unplug it from the back of the radio TX goes off. The interesting thing is when I plug it in at the front, using the earphone connector it works fine. Any ideas?

Thanks!
Matt - W6MCP

Have you tried removing the control head, and cleaning the contacts on back of the control head and the body of the radio and/or the remote cable if it is being used? Can't remember if this has been suggested and/or tried, but if it hasn't I recommend DeoxIT for that task.

# 21247. The MDSR Team makes the LIF even more versatile

Yahoo group: ic706 (2010 — 2015)
Date: 2014-11-12 22:05:38 UTC
From: alexschwarz237@...
Topic: 21247  Message: 21247

Hi Everybody;

The MDSR Team again has extended the capability of the hardware interface to include such popular radios as the K3 and the FTdx-3000. The difficulty in making these radios compatible with the LIF down-converter unit was the difficulty of getting suitable LO crystals which would yield a 12kHz IF for the sound card input.
As a LO can be used any stable oscillator with an output of 3Vpp and an impedance lower than 500 Ohms. Si570 based oscillator kits which have a high frequency stability are affordable and can be configured to start oscillating at a set frequency on power up and provide the perfect LO for your transceiver.
Even though a crystal oscillator has a very low phase noise and excellent frequency stability there are transceivers that can not be covered with the current set of LIF frequencies available. By using the external LO input transceivers like the K3 and the FTdx-3000 which has a 9MHz IF output can be used with the MDSR software.

The MDSR software and the LIF interface allows for a very cost effective and amazingly sophisticated user interface for RX as well as TX. The LIF2014 kit for RX and the BiLIF kit are easy to build and can enhance almost any HF transceiver.

For more details go to:
MDSR Demodulator-Modulator Software Radio http://users.skynet.be/myspace/mdsr
Please download and read the PDF documents with regards to your RIG.
Note: All documentation is free as long as it is used for HAM radio purposes.

If you can not find your transceiver or do not know how to start your LIF project, join our user group at:
https://groups.yahoo.com/neo/groups/mdsradio/info
https://groups.yahoo.com/neo/groups/mdsradio/info

We have created a LIF with an external LO document that will guide you though the conversion. It has 4 simple steps. I can be found in the group in the Photo Album section and the heading: External oscillator connection.

The MDSR team hopes that this will enable even more HAMs to be able to use the LIF and BiLIF converter with their RIGs.

We are also working on the next release of the MDSR software, which will include an update of the DSP engine. The FM modulator and demodulator will also be part of this release. This makes the MDSR portion of the software 100% Java compliant. This means it can run on any OS that has can install the Java RTE (run time environment). Many thanks to the people at SoftSynth for the continued support and for letting us use their DSP software for free. This enables us to keep the MDSR software free of charge for you.

All the best and 73;

The MDSR and BiLIF team
Alex / VE7DXW

Hi it is simple---1. set desired frequency  2.  While in VFO-A. Push RIT/SUB button it will glow a dull red. Rotate memory channel dial until a  memory number reads blank.. 3- Go to M2. Push MW button, you will hear 2 beeps. Frequency is now in memory.  To confirm-- Push the V/M button to show MEMO. Turn memory channel dial to confirm.Good luck and let us know how you made out.... 73-Steve--WB2OEE

Hi Everyone,

I have a 706MK2G I've owned for a while now.. and recently started using it again primarily on 2M. I've got an annoying problem cropping up occasionally.. anywhere on mid-to low power settings on VHF or UHF it will not transmit properly. I don't know how well to describe it, but when it happens sometimes I get a brief high SWR indication, and either power output will drop to zero or I will get a power increase (!). While this is happening I get reports of no or bad audio, and the rig itself makes a strange interference/buzzing type noise that is probably coming out of the speaker (while transmitting).

It has been hard to troubleshoot this issue, it seemingly happens randomly. It can happen on the first transmission on a cold radio or after half an hour on the radio, not happen for several days, etc. It only happens on low power, I have never seen it occur on 3/4 to full power settings which is my 'fix' to the problem currently. I have done the following..

- Tried a different antenna, coax, coax jumpers, no swr meter, etc.. same thing
- I noticed old hardened solder flux on the final drive transistor, cleaned it out with a pick and alcohol, solder connections look good, nothing appears burnt
- Adjusted idle current for final and drive amplifiers, they ended up in pretty much the same spot as the factory alignment.
- I have looked at probably most of the critical solder joints in the rig.. wiggled power wires, coax, board ribbon cables, etc.. I can't force the radio to fail in this way.

I really was thinking it was the antenna or coax, but unless I have two bad antennas, that is not it. Does anyone have an idea as to what else I can check? I have searched the web and so far found no similar issue. I would send it in for repair.. but probably will come back with no problem found. I would like to use low power settings again!

Thank you

Regards,
-Moses

There is an issue with some erratic trimmer caps in the 2m VCO. The Guy to talk to is N1EQ. His name escapes me but he repaired my 706 on two different occasions. Good work and very reasonable.

It might be worth checking the screws around the main pcb are providing a good ground - this was an official Icom 'fix' for an intermittent problem a few years ago but I can't remember the details. Also clean the contacts between the front and the main housing, especially as you say the rig wasn't used for a while.
Hope this helps,

Hi Everyone,

I have a 706MK2G I've owned for a while now.. and
recently started using

it again primarily on 2M. I've got an annoying problem
cropping up

occasionally.. anywhere on mid-to low power settings on VHF
or UHF it

will not transmit properly. I don't know how well to
describe it, but

when it happens sometimes I get a brief high SWR indication,
and either

power output will drop to zero or I will get a power increase (!). While

this is happening I get reports of no or bad audio, and the rig itself

makes a strange interference/buzzing type noise that is probably coming

out of the speaker (while transmitting).

It has been hard to troubleshoot this issue, it seemingly happens

randomly. It can happen on the first transmission on a cold radio or

after half an hour on the radio, not happen for several days, etc. It

only happens on low power, I have never seen it occur on 3/4 to full

power settings which is my 'fix' to the problem currently. I have done

the following..

- Tried a different antenna, coax, coax jumpers, no swr meter, etc..

same thing

- I noticed old hardened solder flux on the final drive transistor,

cleaned it out with a pick and alcohol, solder connections look good,

nothing appears burnt

- Adjusted idle current for final and drive amplifiers, they ended up in

pretty much the same spot as the factory alignment.

- I have looked at probably most of the critical solder joints in the

rig.. wiggled power wires, coax, board ribbon cables, etc.. I can't

force the radio to fail in this way.

I really was thinking it was the antenna or coax, but unless I have two

bad antennas, that is not it. Does anyone have an idea as to what else I

can check? I have searched the web and so far found no similar issue. I

would send it in for repair.. but probably will come back with no

problem found. I would like to use low power settings again!

Thank you

Thank you everyone for your suggestions.

I had forgotten about the faceplate connections.. I just cleaned them out. I'll go through the radio and double check the board mountings. I also found online some instances of issues with failing adjustment potentiometers in the FM PLL circuit.. something else to check. If I find nothing.. I think I'll just order a final transistor, I see you can get them for around $30 online. Worth a try as I have another radio with the same finals, at worst I'll have a spare!

Thanks again

Regards,
-Moses

I recall a Problem with the Chassis Mounted SO-239 Connectors... Check the Solder connections to ground and centre connector for Cold Solder joints... If there are poor connections that would make sense on affecting only on low to mid power!!! Please let us know if that is the solution, as it is a simple fix as no new components are required, just a hot soldering iron, solder wick and new silver solder!

I have an Icom 706 mk1 base unit for sale no display unit or microphone just the base.

Works ok looking for £150 plus £15 postage more details email me at mikem1alt@gmail.com sell to UK only.

I bought this from ebay but the display got damaged in transit and on closer inspection is too far gone for repair the volume control snapped off if you want the dispaly in bits you are welcome to it as well

Thanks Mike M1ALT

# 21260. ICOM 706 MK2 Programmed Scan problem

Yahoo group: ic706 (2010 — 2015)
Date: 2014-12-17 20:24:32 UTC
From: jhamlin2004@...
Topic: 21260  Message: 21260

I'm trying to set up a programmed scan on my IC706 MK2, and having a problem getting it to work right. After setting up the P1 & P2 memory channels as instructed and making sure that "scan resume" is "on", the scan will start but not stop at any active frequencies. P1 is set at 28.3mhz and P2 is at 29.3. I've tried this with either the squelch fully open or closed, but it make no difference . . . will not pause at an active usb frequency. If I understand it right, I start the scan in the VFO mode. What am I missing?? Probably an "operator error", for sure! ???

Does SCAN work for ssb? Or just for a solid carrier in FM mode. Don’t know and don’t have a book to look it up but seems reasonable. Until told otherwise I wouldn’t expect conventional scanning to work on ssb. Just on something that had a good solid carrier.

From: guenhwyvr@...
Topic: 21260  Message: 21262

The trick here is that you have to be in VCO mode, not Memory (Menu S2, soft-key 4 (V/M)) If you're in Memory mode, there will be a "ch" indicator on the lower right side of your display, IIRC (my mkIIg isn't in front of me at the moment.

From there, your radio will scan from 28.3-29.3 and repeat, if you have those band edges set up as "channels" 1A and 1B (You will have to be in Memory mode to do this. Select channel 1A, "Mem" the band edge frequency you want, go to channel 2B and do the same for the top band edge freq)

Now, remember that scanning will only work the way you're used to (like in CB's or police scanners) on FM carriers. In SSB, you'll have to listen for audio characteristics that change rapidly, and bump the VCO dial when you hear one. That will get you close, then you just have to dial it in.

If you are scanning for FM on 10m, the scan function will stop whenever a signal exceeds the squelch threshold (set by the ring control on the volume knob).

Hope this helps!

73, and Merry Christmas!

I need the underside of the radio, the side where the bracket is on the chassis the board by the 13.8v power socket and cable this socket lifts out of the chassis and the info about my repair is there.

So with the radio up side down and the display and knobs facing you, and the power socket out of the way it is the top right hand corner.

Many thanks

I use an LDG AT200PRO, and/or a simple MFJ 942? tuner, both work great for this rig.
Remember the auto tuner wont tune balanced lines, (ladder line) only coax fed antennas UNLESS you use for instance the LDG 4:1 balun.
If you run a dipole with coax, auto tuners work fine.

How much power are you planning on running (although for $200 and $100, respectively, you'll pretty much be limited to 100 watts output) and what type of antennas? Balanced feedline antennas or coax-fed antennas? Desk-top tuners or remote-mount at the antenna feedpoint?

Having owned 706s for some 15 years, I have to say that for the most flexibility and efficiency, it's hard to beat the ICOM AH-4 autotuner which plugs into the Molex tuner port on the back of the 706 and enables the "TUNE" button on the front panel of the rig. Although other manufacturers have autotuners that are compatible with the 706 and "mimic" the operation of the AH-4, the 706 and the AH-4 are designed to work together. The AH-4 is a much more versatile tuner than commonly given credit for. You won't buy a new one for $200.00, but I've bought several in the $175.00 to $225.00 range.

I have owned at least one AH-4 during the past 15 years.

Aside from the AH-4, LDG makes autotuners that are "plug-compatible" with the 706, as does MFJ, but all those are desk-top as I recall.

ICOM also makes a desk-top autotuner as well; both it and the AH-4 are described in the 706 manual.

I use the MFJ-993B. It’s a little over your budget at $220 from hamcity.com or GigaParts. It comes ready to go for use with balanced line or coax. I’m running a 102’ dipole with balanced line feed. It is a very flexible tuner and will work with balanced line or coax and will accept random wire antennas. The LDG tuners work very well too.

Hi all. Thanks for the helpful comments. I'm leaning toward an LDG IT-100, based on size, price, features, and user base. After looking at a few on eBay, it appears a better deal is to buy it new, shipped, for about $170. Though a home rig at present, I've designs on building the 706 and tuner into a go-box.

Still looking at a small MFJ manual tuner for crazier antennas. It looks like the small ones give up the ability to run random wire. Ideally, I'd like a dummy load integral.

In my earlier post, I failed to mention that I sometimes use a very inexpensive, light-weight, MFJ manual tuner out in the field with my 706s, an MFJ-900 "Econtuner."

I bought it for something like $20 or $25 from another ham off eBay some 15 years ago, looks like crap on the outside, looks brand-new on the inside, and works quite well for what it goes.

It has a provision for both coax feedline and a random wire. Although the "manual" claims it's rated to 200 watts, I don't put more than 100 watts SSB or 50 watts constant carrier through it.

MFJ still sells later versions of this tuner to this day, although the models with the built-in SWR/Wattmeters will exceed your $100.00 figure by $20 to $30.

I've trialled an LDG Z-100 and the Icom AT-180 neither were any use at all. The AT-180 is only meant as a companion line trim for the IC706 and thats all it does. I was surprised the LDG wasnt effective on any of the antennas I use it would either trim an antenna which was already near enough - or spit the dummy and remain in bypass. I tested this both mounted at the radio and at the antenna base. I tested on mobile helicals, aircraft wire (both open end and loop) and at home with wire antennas.

The tuners I use the most on my 706 & 706Mk2G are some rather old Kenwood models - AT120 and AT130.
The good thing is their size (and cost) they are a bit fiddly due to the small knobs.
The AT130 has the WARC bands - although thats not critical both will operate OK including 5MHz but they dont do 160m or 6m I just leave them in bypass.

I found a used LDG AT-100PROII w/ cables on eBay for 165 shipped. A little bigger than the IT-100 but has displays and a second antenna. Think it has more memories too. There was an AT-200PROII for about the same w/out cables but it slipped away before I could nab it. Unsure why I'd need a 200 with this rig as if I ever run a linear, I'll use a different set up and need much more than the 200. Do people just use the 200 as a safety margin or for use with their other rigs?

Thanks for your suggestions.

Now for an antenna. While I can whip up (ha) a dipole, what should I attach to the LDG for widest coverage? Probably looking for a stealth dipole in the attic initially. Ideally would like the 2 elements 30 feet together or shorter. Is there a good performer someone has experience with in an attic application? Thanks again.

I use the LDG IT100 with mine and it works very well.. typically I use it to tune a full wave loop fed with 450 ohm line which means I have to go through a 4:1 balun but that's just fine. Except with really wild impedences it does great. Just my .02 worth

Actually this is a question on all Japanese multimode radios..MOST of them do NOT allow the NB to work in the FM mode....some older ones did (My KW TS680, Yaesu FT690MkI and 690MkII do!) but it seems most modern rigs don't do that and the answer I get from their TAC groups is "The radio performs as designed".....

Yeah thats some good news!! Ever been at a bad spot where the electrical noise causes a S9 reading on FM and SSB but turn on the NB and it drops to S3 on SSB but still S9 on FM?? DUH!! If they think FM does not need a NB, why does EVERY COMMERCIAL LMR lowband rig have them (and even the GE Mastr II offered it in their 136-174 MHz models...one rptr site I had needed it...the noise at 2m was horrible but at 220, it was QUIET)...

I have wondered if anyone has found a way to enable the NB in the FM mode on the IC706MkII?? If so, how easy is it? My feeling is I would have it on all the time and if it was tearing up something like AM broadcast, etc, its easy to go to settings and turn it to 0..On 10 and 6 AM modes as well as FM, the NB is really needed.....

Anyone done this yet?? I am scaning through the service manual to see if I can find a way to do it...even if I had to add a switch to enable/disable it in FM mode..(a small slide or push on/off button would be easy to do)

TIA and Happy New Year

I wonder if it is because the manufacturers consider these HF/VHF AM/CW/SSB/FM radios more of a base station then a mobile radio when they design them? FM mode LMR mobiles are designed for exactly that, mobile operation.

The IC-706 noise blanker is effective on impulse noise, such as ignition noise. With modern ignition systems switching to Direct Ignition (or coil on plug) the distributor and high voltage wires are eliminated. This is probably why modern cars have less ignition noise. The noise problems now in autos seem to be microprocessor related, which the IC-706 noise blanker may not be very effective to eliminate.

The NB in the 706 series is located in the 9MHz narrow IF and of the impulse gating type, if this circuit were to be used for FM mode it would actually make that type of interference worse. The FM demodulator at 455kHz uses hard limiting and no AGC to swamp any impulse noise.

The older radios may have used a noise limiter in the audio, rather than a noise blanker in the IF. The 706 is different to the Mk2 and later in the placement of the blanker prior to the filter, there is an unofficial mod to fix this (for ssb)

But then most later rigs have DSP which works in the narrowFM mode so if you really need it thats OK.

Both my 706 & mk2g dont have a very effective NB on ssb, it can be adjusted internally for the situation but even then its not fantastic. it also degrades AM so I wouldnt want it for NBFM

Larry,

Here are a few on the east coast that get good reviews:

www.landaircomm.com

http://n4ats.com/

http://www.hamradiorepairfix.com/

Good luck with the repair. Paul Hansen (W6XA) also gets high
recommendations as a repair center.

You might check with B & H Sales in Derby, Kansas. Be aware, though,
that they can be a bit slow, as their tech, Carl, is not full-time. He
works there as a sideline. Their website is
http://www.hamradiocenter.biz/ and their phone# is 316-788-4225. They
are an excellent shop, and I'm in there at least every other week
chatting and browsing the latest goodies to come in.

Hi Larry - You might try

MTS
Scott Malcom
5130 Jackson Hwy
Toledo, WA 98591

mts@...

I believe he is an ex-Icom guy but not sure.

He came highly recommended to me by over a dozen people in my two radio clubs.
I actually found the problem with my IC-706MKII control head myself (I was lucky) but he was very responsive and helpful
in the 4 e-mails we exchanged.

Good Luck!

73,

Dave N7RK

# 21299. The MDSR Team releases MDSR V3.0

Yahoo group: ic706 (2010 — 2015)
Date: 2015-01-14 19:36:10 UTC
From: alexschwarz237@...
Topic: 21299  Message: 21299

Hi Everybody;

It is almost a year since the last full version of the MDSR software was released. Now the MDSR team has worked hard to update the DSP engine and to make the software even more versatile. The new audio DSP engine now runs 100% on Java. Experiments on Raspberry PI are already on the way to extend the platforms MDSR can run on.

With this new version of the MDSR software upgrading your existing analog transceiver to an IF-DSP is even easier.

The new version is again free of charge for the HAM community. It and instructions on how to build a LIF or BiLIF converter are on our site in PDF documents. As well as the documentation on how to connect your transceiver and the computer together can also be found on the MDSR website.

Please Note: All information on this website is free and everybody is allowed to use this information to enhance her/his station.

For HAM radio operators that do not have the time to build their own interface we do have kits available. Please see the website for more details. We also can assemble and test these kits for you!

Our website:
http://users.skynet.be/myspace/mdsr

Our Yahoo user group:
https://groups.yahoo.com/neo/groups/mdsradio/info
https://groups.yahoo.com/neo/groups/mdsradio/info

All the best and 73;

The MDSR Team
Alex / VE7DXW

From: Dennis W0JX
Topic: 21301  Message: 21301

The 706 is a fairly good CW radio if equipped with a good CW filter and the DSP unit.

I use my 706MK2G for mobile CW on 40 thru 10. I have the 350 Hz filter which is just about right and the DSP unit. I think the 500 Hz is a little to wide. The main weakness of the 706 is the noise blanker which does a good job on ignition noise but the radio distorts in the presence of very strong signals.

My observations are about the same, except I have the 706 original, so no DSP unit in it, but use the 350hz CW filter both as a base rig and mobile. I didn't find the DSP in the later model 706s to really make that much of a different. Unfortunately the DSP unit doesn't contain bandpass filtering like the Yaesu DSP does in the FT100/857/897. You can't use the autonotch on CW in the Icom 706 either, so about all you get is noise reduction, which helps a little but it not that big of a deal on CW. The narrow filter helps much more.

Hi _ I have  the 706MK2G, I have the 250 cycle CW filter with the bandpass control. Only in my home, no mobile work..When i use the 2-together, it provides excellent results, on very weak signals when adjusted poperly, it evens peaks the audio and may make the weak cw signal sound a bit stronger. I do not use the DSP unit, so cannot comment..73-Steve---WB2OEE

RE: Noise Blanker.
..
A note in general.
I haven't been able to find out just how these noise blankers work on modern rigs. It's all software these days, but...
Original, highly effective "analog" noise blankers actually used another receiver. It was rather broad band and 'listened' out of band and was not as sensitive as the main receiver. They were intended only to pickup short ignition noise pulses.
..
Because the blanker IF had a wider bandwidth, it had less delay through it. The impulse that came through the secondary receiver was used to blank, or kill the main receiver gain early in the IF so the impulse didn't even make it to the narrow IF filter. Everything was designed only for the short impulses.
..
Narrow filters have a longer reaction time and would actually lengthen the pulse on its output and make it sound worse, so keeping the impulse out of the filter in the first place made an impressive silencer.
..
They were not made for any other kind of unwanted noise. I've seen comments on how ineffective they are on general noise, obviously because the term noise "blanker" is new to many and misunderstood.
..
These blankers seem to operate similarly, but if a strong signal gets into the secondary chanel, it can mess up the main channel. The poor strong-signal performance is most likely related to that.

Hello All

I have an Icom 706MKII that I bought last week. Nice little radio and the plan is to install it in a 2010 F-150.

I was told that having the power cord connected to the radio when the truck starts up can cause voltage spikes to cause damage to the radio.

Just wondering if anyone here has experienced that, and if not what precautions did you take to protect the radio.

Thanks
Rick VE3FMC

Isn't that what in-line fuses are for? Can't say I have heard of any similar reports.

The starter can drop the battery voltage below the minimum operation limit and can cause large spikes on the line.

I don’t know about the 706 but the low voltage has been known to change settings on some rigs.

Its best to turn the rig off while starting the vehicle.

You could put a relay with a voltage sensor circuit to automatically shut the rig off while starting. Don’t know anyone who has done that but it should be simple enough to do.

Tony

The question is leaving power cord hooked up...not leaving radio on. I have had my MKII in my '94 Bronco since vehicle was new. Never have disconnected power. Beware however the radio may be unusable with engine running due to fuel pump noise. I do have this problem. Fords are notorious for this.

Hi Ron

I did a quick fuel pump test as my 706 came with a cigarette lighter plug on it. So I just plugged it into the acc outlet and did not notice

any noise when first turning the key on which would activate the pump. I did have noise when the truck was running. But when the RPM's reached 1600 RPM the noise died down. Strange!
Someone told me they lost all power in the radio after starting their vehicle up, had to send it to Icom for repair. But maybe he left the radio on before he shut the vehicle off.
I had 4 other replies and no one seemed to know of any issues that I mentioned.
Thanks Ron

The radio will fail to protect the fuse. Semiconductor junction punchthrough due to voltage spikes happens in micor- or milli-seconds. The fuse cant fail that fast and the current may not be enough to blow the fuse anyway.

One reason to connect the radio directly to the battery. A battery is certainly a good filter. Additionally, use a "ChargeGuard" with your radio. It will do a couple of things. The radio(s) will stay powered off until after the vehicle has started. It will also give you a timer that will power off your radio after a time setting. Then you won't need to worry about leaving your radio on and having a dead battery. And along that line, if the battery voltage goes to low, it will power off the radio. Been using them for years.

NO! Fuses are for over current. Nothing to do with spike suppression.

Same here. I would bet money that the vehicles that have had problems run much higher voltage than 13.8. My dual-battery F250 diesel runs a little high (14.2), but as you approach the max cap voltage, these things will happen. Add heat + time, and well, swollen caps would be expected. I've personally seen vehicles with over 15v out of the alt. I have a full-time voltage gauge in my truck to keep an eye on these things. Usually, it tells me we'll ahead of time of upcoming battery or alt failures.

Now it appears that the "problem" is if the radio is left "ON" when the vehicle is started, which I may have missed in the original posting.

Not familiar with the "ChargeGuard," but if the issue is causing someone sufficient concern, then MFJ sells a relay designed to protect the radio:

http://www.mfjenterprises.com/Product.php?productid=MFJ-4402

"A built-in surge protection diode reduces the chance a high voltage spike will damage your rig due to an alternator failure or jumping off from other vehicles, and it has reverse polarity protection.

MFJ-4402 will cut your rig off if the voltage gets too low for proper vehicle operation.

A delay timer, which is controlled off of the ignition sense line insures that your rig doesn’t turn on until the vehicle starts up and a normal voltage is reached."

A little pricey, IMHO, and someone's who's handy enough with a soldering iron and basic circuit design could DIY for a lot less probably.

I personally operate my ICOM IC-706 MKII through an MJF-706 "EMCOMM Go Box" that I bought from Phil Salas, and it provides a bank of capacitors with 4 Farads of capacitance, and a relay to "buffer" the radio from the vehicle power.

From: <awaschka@...>
Topic: 21306  Message: 21324

If I remember correctly, the power switch does not remove power from the final transistors. They are always powered on, so if there is a spike on the 12V line, it will go to the finals whether the radio is on or not.

The mechanism is called “load dump” and is a primary specification for equipment installed in vehicles. The starter draws several hundred amps part of which is supplied by the alternator, part by the battery. When the solenoid opens, the current wants to keep flowing and the result is a large voltage spike. The battery does act as a pretty good filter and thus the reason to connect the radio directly to the battery. I have had multiple radios including a 706MkII connected directly to the battery with no issues, but I have also read about those who have had problems.

Now it appears that the "problem" is if the radio is left "ON" when the vehicle is started, which I may have missed in the original posting.

Not familiar with the "ChargeGuard," but if the issue is causing someone sufficient concern, then MFJ sells a relay designed to protect the radio:

http://www.mfjenterprises.com/Product.php?productid=MFJ-4402

"A built-in surge protection diode reduces the chance a high voltage spike will damage your rig due to an alternator failure or jumping off from other vehicles, and it has reverse polarity protection.

MFJ-4402 will cut your rig off if the voltage gets too low for proper vehicle operation.

A delay timer, which is controlled off of the ignition sense line insures that your rig doesn’t turn on until the vehicle starts up and a normal voltage is reached."

A little pricey, IMHO, and someone's who's handy enough with a soldering iron and basic circuit design could DIY for a lot less probably.

I personally operate my ICOM IC-706 MKII through an MJF-706 "EMCOMM Go Box" that I bought from Phil Salas, and it provides a bank of capacitors with 4 Farads of capacitance, and a relay to "buffer" the radio from the vehicle power.

Topic: 21306  Message: 21325

I read the e-Ham article that apparently started this thread, and the author claimed that attaching the power feed lines directly to the battery did not solve the issue, as you describe.

Perhaps adding capacitor/s to the power lines in addition to the in-line fuses would be additional "insurance?"

From: Ralph Mowery
Topic: 21306  Message: 21326

Unlike many radios of years gone by, many rigs today do not disconnect from the power when cut off.  The switch only goes to a pin on the micro processor or other solid state device.  While in the off state, the rig is still mostly connected to the power source.

my 706mkIIg has been connected directly to the battery since I purchased it many years ago.  no issues.  but I don't start the engine with the radio on.

'73,
rich, n9dko
Good judgment comes from experience and experience, well that comes from poor judgment.

OK thanks for the all the replies. I talked to a guy who installs radios for a living and he said he would not be too concerned. He can install the relay if need be. It appears that lots of guys have run that radio in their vehicles over the years and never had an issue.

Thanks, 73 to all Rick

Regarding the e-Ham article which prompted all this discussion, read the comments to that article, particularly the one by Alan Applegate, K0BG, who has one of the most comprehensive mobile radio websites on the Internet.

That message thread on eHam is nearly 10 years old. That is approximately how long I've been actively monitoring this list and I've never seen or heard of this problem. I read through the entire thread on eHam and I find it interesting that outside of a couple of responders that had similar problems, no one else has experienced this problem. The OP ends the thread by stating that HE knows of 600 other owners that have had the issue. He doesn't provide any other proof of that statement and I suspect that it is grossly over-inflated.

This is obviously NOT a major defect in the 706 line or we would have heard volumes on this issue over the last 9 + years. I've heard not a peep! IF this was the alleged "Major Defect" that was asserted in the article in 2005, replacing those capacitors would be on every MOD list for the 706 series. I'm not seeing it!

Follow the manufacturers instructions for installing the radio - you should be fine. This falls into the category of "I heard it on the Internet - It must be true"

Apply a little common sense to the situation! One obscure 9 year old thread on a well known web site does NOT a "Major Defect" make!

It's not unheard of for certain hams, presumably through their own superior technical expertise, to "discover" certain previously undiscovered "defects" etc., in products, and then post or publish self-laudatory articles attesting to the dire circumstances presented.

Not necessarily saying that's the case here, but the fact the author claims it's such a serious defect, yet so few reports of actual adverse incidents, makes one wonder.

Here is one of the newer style ChargeGuard's they make:

http://www.havis.com/data/3-Power%20Management/Chargeguard/CG-0006-IS-E.pdf

<http://www.ebay.com/itm/Havis-Charge-Guard-12V-Auto-Timer-Switch-Safe-Inverter-Vehicle-Laptop-Battery-/271745496125?hash=item3f454b343d&vxp=mtr>

One of the options with this model, it will sense when there is AC on
the line, so it knows when the alternator has started working and then
it will turn on the load. Not going to turn on the load during starting.

I'm sure much better quality than anything MFJ would make. And for the
price, I wouldn't even bother to try to build one. I just bought a new
one last week for $15.

Wow! Really? The alternator will actually supplies part of the power when the starter is running? You better go back to auto mechanics 101 class. And most of the newer (GM any way in the past 30 + years) alternators have a delayed start to charging.

I guess if it is on the internet, it has to be true. Geeze!

> If I remember correctly, the power switch does not remove power from the final transistors. They are always powered on, so if there is a spike on the 12V line, it will go to the finals whether the radio is on or not.
>
>
> The mechanism is called “load dump” and is a primary specification for equipment installed in vehicles. The starter draws several hundred amps part of which is supplied by the alternator, part by the battery. When the solenoid opens, the current wants to keep flowing and the result is a large voltage spike. The battery does act as a pretty good filter and thus the reason to connect the radio directly to the battery. I have had multiple radios including a 706MkII connected directly to the battery with no issues, but I have also read about those who have had problems.

If it's a big deal, then the easiest war to protect the rig is to turn the radio off when stopping and always start the car before turing it on. I've never once had any issue with this or any other radio mobile, from the 706 to the old Kenwood 440 and lots of rigs in between.

I think this is really a non-issue.

Many rigs now do not disconnect the power when turned off.  They just set a bit in a microprocessor or some other solid state off function.  Most of the semiconductors are still connected to the power line.Turning off the rig will provide very little if any protection.

Yeah, i guess that was dumb on my part. I was thinking about more general load dump events when i mentioned the alternator. But it still remains that the sudden cessation of a large current draw will result in a voltage spike.

And it really wasn't necessary to be such an *ss when pointing out my mistake.

A few years back I bought a relay that I was intending to install so as
to keep power off the radio during the starting routine -- but I never
got a round tuit.

True. Several years ago I found that our car's battery was flat after it had sat for just a few days, and it turned out that one of the 706MkIIG's finals had significant leakage current. I'm pleased to be able to report that that was when the old Motorola finals were still available.

I run an original 706 not mk2 mobile.
I have a 8 gauge pair connected directly to the battery and
running to a terminal block mounted on the rear of the radio
mount that sits on the hump in front to the front seat.
All the radios are connected directly to the battery through
this terminal block. I've never had a problem with the radios.
I try not to have the radios on when I start the car but I'm
sure I've slipped up a few times over the years but it's never
caused a problem.
I have a separate switched power feed that some things are
connected to, GPS, radar detector, and fan on the Midland 6mtr
LMR rig mounted in the trunk.

What I would like to find is a decent price and source for one
of the battery protectors that will monitor the battery voltage
and disconnect the load if the voltage drops below 12v.
No matter now hard I try to remember it never fails but what
I'll leave something on over night and run the battery down :)

I love my 706 mobile, I'm having a ball working HF while
riding around.
I wish there was a HF call freq for mobile operators to
check into. I usually listen to 14.300 the Maritime Mobile
net, it's interesting to listen to folks of ships and boats
checking in and the take regular non maritime checkins.

I usually stay on 20 meters, if you're around in the early to
mid afternoon listen for me (W4RON) on 20 and give me a call.

Cheers

From: LARRY J. FORD
Topic: 21338  Message: 21341

In the "4" Call Region, a lot of mobile HF operators check into the SouthCARS net on 7.251 MHz, which operates from 8AM to 1PM daily.

You really have to wait until NCS specifically calls for "mobiles/portables/QRP" as the base stations will step on you and you'll never be heard on the "open" net call. SCARS now has over 10,000 "registered" members, so it's beginning to resemble the old Yogi Berra quote about a famous restaurant in New York City when he was playing for the Yankees: When asked if he still frequented Toots Shor's, he replied: "Naw, nobody goes there anymore; it's too crowded!"

I also check-in to the MIDCARS Net on 40, when certain NCSes call which I've found can hear me quite well from SWNC(one in Ohio and one in Nashville, TN).

A 40 meter Hamstick works just fine for both.

Radio Shack sells a stereo-to-mono adapter plug that may solve the plug compatibility issue.

I have several of the iClever IC-BTT01 transmitters from Amazon. They are attached to TVs and radios around the house, and couple to the neck loop for my Hearing Aids. The unit has a USB power cord, so you will need a USB adapter, and possibly, a USB extender. As mentioned, the have a 3.5mm stereo plug.

Regards,
Ed - n5kzw

Topic: 21346  Message: 21346

I just scored a really cheap MK2G, and it works great on RX. But as soon as I press PTT on ANY MODE or any BAND it immediatley shuts the rig off, Power level set to minimum
OK Internet troubleshooters, what could cause that to happen? Havent' cracked the case yet or downloaded the Service Manual. No at power supply problem. PS good at 13.8VDC

# 21347. Re: [ic706] IC706MK2 shuts down on TX

Yahoo group: ic706 (2010 — 2015)
Date: 2015-01-25 06:41:55 UTC
From: John Geiger
Topic: 21346  Message: 21347

Make sure the fuses in the cord are both good. I have had a couple of times where the power showed 13.8 volts, but the fuses were barely blown. Good luck with the fix.

From: ku4pt@...
Topic: 21346  Message: 21349

The 706 spikes to full output for a fraction of a second even if set for the lowest power.

I would check the connector on the rig and power cord. Then any fuse or connector in line with the power lead. Next makes sure the power supply is not shutting down.

There is a fuse or two inside the rig that may not be making a good connection.

I would open the Icom up and put a voltmeter across the power wiring inside the rig to make sure the voltage stays up inside the rig.

Years ago I help a fellow that had a rig in is car that would shut down. Found the wire at the battery was really corroded up and was just barley laying across the terminal. It would pass the few milliamps to run the receiver, but not the transmitter.

The original poster stated in his post: "Power level set to minimum"

It shouldn't draw anywhere 20 amps (that's a full power setting) if the power output level is set to the lowest level (unless something is seriously wrong with the rig).

Personally, I have always run my 706s with a PS capable of more than 20 amps, just to add a little "headroom" to the PS's ability to meet the rig's current requirements.

From: Mike Gormley
Topic: 21346  Message: 21353

The original comment I responded to was "Power supply insufficient?",
So I did not mean to imply at low power he was drawing 20 amps. His
PS STILL COULD BE INSUFFICIENT if it is a PS of LESS AMPS, depending
upon how much less it is.

# 21354. Re: [ic706] IC706MK2 shuts down on TX

Yahoo group: ic706 (2010 — 2015)
Date: 2015-01-25 22:21:21 UTC
From: LARRY J. FORD
Topic: 21346  Message: 21354

Roger. Since the original poster has not reported the current capacity of the PS, only that it's voltage output was 13.8 VDC, we are left to speculate.

One of the reasons that 706s are not efficient as battery-powered, field-use QRP rigs (as opposed to a Yaesu 817 or ICOM 703) is that it has a relatively high current draw even at "low" power settings (roughly 7 amps draw at 5 watts out, according to 706-user sources on the web).

# 21355. Re: [ic706] IC706MK2 shuts down on TX

Yahoo group: ic706 (2010 — 2015)
Date: 2015-01-26 02:38:52 UTC
From: mikerodgerske5gbc@...
Topic: 21346  Message: 21355

Some have also had problems with non icom molex connectors.

It does sound an awful lot like starving power issue so I'd verify voltage drops are not occurring.

73
Mike R

Jimmy & Jimmy we will miss you.

Thanks for the music. Rest in peace. Little Jimmy Dickens and
The singing Cajun Jimmy C. Newman.

I’m looking for a IIG although I might be interested at the right price. The last two model IIg rigs have been sold on this and the blind ham lists for $500 each.

# 21363. Icom 706Mk 2 VHF RX problem

Yahoo group: ic706 (2010 — 2015)
Date: 2015-02-06 20:09:52 UTC
From: mikem1alt@...
Topic: 21363  Message: 21363

Are there any known problems with the Icom 706mk 2 RX? mine is deaf and the S meter is down about 3 S points compared to my MK1.

I had the known issue with the MK1 which was the inductors under the power plug that broke off that was just a simple solder repair but the board on a 706mk2 is quite different

Any ideas?

Many thanks
Mike M1ALT

"Are there any known problems with the Icom 706mk 2 RX? mine is deaf and the S meter is down about 3 S points compared to my MK1."

The MKII is notoriously deaf and will sound as expected with the pre-amp left on at all times.

Kurt

# 21366. ic706 on/off without faceplate

From: mikem1alt@...
Topic: 21363  Message: 21367

Further observations this is right across the bands on FM! so the FM is the problem. FM is very distorted no S meter and the volume varies from normal full hiss to muted and muffled.

Topic: 19055  Message: 21369

That was me that posted the original message but I didn't get any replies or email about it. Just did get this rig fixed though and got it back yesterday 02/10/2015. I told a friend about it laying in my closet with the problem and he told me to drop it off and he would look at it. He found the relay that mutes the speaker during transmit was stuck on. Instead of removing the relay and chance doing damage to the board, he mounted another mini relay inside the rig somewhere (don't know where - haven't looked yet) and connected it to a source of 8 volts during transmit to disconnect the speaker which is all the original does. Now it works like new. Had it on the air last night and got good reports of transmitted audio.

Hope this helps !

While some rigs support it, the 706 has no command code defined to turn the radio on/off via CAT. Unfortunately, the 706 lacks many CAT commands that would have been great to have (such as the ability to name memories).

There is no such thing, you are miss informed, truckers can use there mic and talk on CB radio no matter were they are. Same with amateur radio operators in their cars or a truck use of a mic is allowed, in fact I have some friends that use leg key's to operate code going down the road.

What trucker's can be fined for is the use of radar detectors which is a real hefty fine across the country

Scott Malcom worked for ICOM for over 10 years, he is a top notch repair person, his hourly rate is fair and below what ICOM charged.

I have taken a number of my radios along with some of my friends equipment to him. In fact I now have have a IC761 sitting in his shop from a friend who became a SK a short time ago.

One thing is that he only works on ICOM and KENWOOD radios, no Yaesu,believe me I have gotten on my hands and bended knee ask him to repair one, no luck.....

The other thing is since Icom stop repairing allot of the older Icom radio's he is backed up at time's, but he gets the job done it just takes a bit longer.

I'll add, you can use a mic but no longer can you talk on a phone by actually holding it in a commercial vehicle. Maybe that's the confusion.
In the USA anyway.

The 706 doesn't use a memory battery. Try removing the faceplate, cleaning the contacts, and putting it back on.

Along with the previously mentioned possible fix I would also like to offer an additional suggestion. All the internal circuit boards have ground connections by way of small Phillips type srews that hold the boards to the radio chassis. It's a good idea to occasionally tighten all those screws as there are many ground return paths by way of those properly tightened connections.

I have had that problem with the icom 706. However strange that you would have the problem with a car. I used to have the radio with a screwdriver antenna on 3 different BMW motorcycles. With the small size batteries on the motorcycles I would have problems with power spike on the radio if i had it on while starting the engine.

These radios are bullet proof! I don't ride the average season of riding for Minnesota. (2500-4000 miles) I usually try to ride every month. The radio used to be on the beemer in the rain and snow. However after getting the radio repaired 3 times the tech recommended that I keep the radio off the BMW.

I think the HM-103, being classified as a "spare part," was always more expansive than one of the "accessory" microphones with a touchtone pad, so one of the current Icom ones (HM-154T, perhaps -- from memory) may be cheaper than all but a cheap "knock off" of the HM-103.

The HM-103 has a Heil Sound mic element in it, and the Chinese "knock-offs" almost assuredly do not.

The HM-103 mic is generally noted for good audio. In contrast, the Chinese version of the HM-36, supplied with a number of the current ICOM base rigs (e.g., 7200, 718, etc.) is almost universally "panned" for poor audio.

Frankly, I do not know about the HM-154 T. I have one, have used it sparingly with either of my 706s, but have not had reports of "poor audio," which may just be from a lack of sufficient sample size.

Another alternative, and one that I use with my "original" 706 that is a back-up base HF rig, is to use one of the small Heil headsets. I use a Heil Traveler headset (now the Heil "Micro," I believe) with my base 706 (and my main rig, a 7200) and get good audio reports. You will need to build an interface or buy the ICOM OPC-599 to convert the 8-pin round mic connector of the Heil headset to the 8-pin modular mic jack on the 706.

I bought a replacement or extra at a hamfest I believe from Tower Electronics. I believe it was actually for other icoms. I guess it could be a Chinese model as it was $20 a few years ago. Seemed to work ok but just keep it as a spare. It's size is like the 154 which is nice.

# 21385. 2M TX off Freq

Yahoo group: ic706 (2010 — 2015)
Date: 2015-03-05 04:48:35 UTC
From: ac2gl@...
Topic: 21385  Message: 21385

I'm new to this group, and having just bought a 706MK2G at a ham auction, I thought this is the goto place for help.

While using it for the first time on a traffic net, the CO said I sounded off frequency.

I've set the RX frequency to 147.2550 with +600 offset.

The radio says it's transmitting on 147.8550, however my frequency counter says 147.8535.

I've checked the 60MHz reference oscillator, and it's right on the money.

I tried searching the messages, but yahoo brilliantly doesn't support searching for keywords.
Has anyone had any similar problems, and what was the cause and cure?
Thanks! 73 Dave AC2GL

Well, I think I remedied the problem for now anyway. The problem with the original was a bad cable. The original cable had been damaged when I bought the rig used and I picked up a used Radio Shack mic at a hamfest for a couple of bucks a few years to use the cable off of it to replace the one on the Icom mic. That worked for a while but it was a cable from a mic made for the HTX-252 2 meter rig and these cables are known for self destruction in that they just start crumbling apart ! Don't know what they made it from, but I call it a biodegradable cable ! Anyway, for now I had a small speaker mic that did not fit anything I had, don't even know where I got it but it had a condenser mic element in it and a good cable. The speaker mic is a Pryme brand which is a commercial grade mic. So I cut the plug off that cable, rewired the inside of it to work with the 706 by adding a 10K ohm resistor to feed +8 volts to the element then a 0.1uF cap to block that DC from getting on the audio line. Added an RJ45 plug to the end of the cable. On the air audio reports switching betweem the HM-103 and the newly wired mic stated that the new mic sounded better and stronger than the the HM-103. The new mic shows more output on the wattmeter two but

everyone says its crystal clear with no distortion even when I'm talking into it from a foot away or close up. I did remove the tiny speaker and added a foam pad in its place to act as a pop filter. Its kind of small for my hand but will work until I find something better.

On another note, I've heard folks say that the mic element in the HM-103 is about 1 inch in diameter or bigger. Well, on close examination, that is not the mic element but seems to be some sort of ballast weight maybe. The actual mic element is about 3/8 inch in diameter and mounted on the back side of the small circuit board. The big round metal piece has no wires going to it at all !

KC8AON

0 Attachment

The HM-103 has a Heil Sound mic element in it, and the Chinese "knock-offs" almost assuredly do not.

The HM-103 mic is generally noted for good audio. In contrast, the Chinese version of the HM-36, supplied with a number of the current ICOM base rigs (e.g., 7200, 718, etc.) is almost universally "panned" for poor audio.

Frankly, I do not know about the HM-154 T. I have one, have used it sparingly with either of my 706s, but have not had reports of "poor audio," which may just be from a lack of sufficient sample size.

Another alternative, and one that I use with my "original" 706 that is a back-up base HF rig, is to use one of the small Heil headsets. I use a Heil Traveler headset (now the Heil "Micro," I believe) with my base 706 (and my main rig, a 7200) and get good audio reports. You will need to build an interface or buy the ICOM OPC-599 to convert the 8-pin round mic connector of the Heil headset to the 8-pin modular mic jack on the 706.

It depends on when your IC-718 was manufactured, as the earlier model HM-36s were manufactured in Japan, are are of much better quality. The later versions of the HM-36s were outsourced to China, and have had a checkered history as to audio quality.

That's why I said "current" ICOM base rigs in my postings.

If you doubt what I'm reporting, subscribe to the IC-7200 Yahoo Group and there is an extensive discussion of the issue, including numerous complaints about the audio quality of the HM-36 over the past couple of years.

I replaced the hand mic on my MK II G with an Astatic hand mic. I used a 4

pin round to Icom modular adapter from eBay and got the mic at the local truck stop. I've used these mics for years (mobile on children's band) on both cb's and another 706 I had. Have gotten good audio reports. I prefer the larger size... Kinda like he old Motorola "cast iron" mics. Just fodder

for consideration.

There are several "fixes" for the reported audio issues with the later model HM-36 mics.

Here's one that a guy with a 7200 and the HM-36 devised:

http://www.k7sfn.com/cms/index.php?option=com_content&view=article&id=62:hm-36-modification&catid=25:homebrewing&Itemid=59

A friend of mine locally received a new IC-718 from his son about 2 years ago as a birthday present, but got the same "low," "muddy" audio reports as the ham in the cited link reports.

I think this is the mod he performed (or one very similar) and it improved the audio reports on his IC-718 dramatically.

There are more out there on the Internet, and some are posted on the Yahoo 7200 Group site.

I have an HM-36 with my 7200 that I got about 5 years ago. I don't know what the audio quality is because I've never used it. I use a Heil Traveler headset with my 7200 (and 706s) and the HM-36 sits gathering dust.

There are several "fixes" for the reported audio issues with the later model HM-36 mics.
<snip>

A mod that I'm going to try on the mic (HM-36) that goes to my IC-718 since I have an HM-103 on its way for the 706, is to take the element out of my old HM-103 and install it in my HM-36. The element in the HM-103 is supposed to be a Heil cartridge of superior quality so I'm hoping I t will improve the audio quality of my 718. But then everyone I've talk to makes comments about how good the audio sounds on the 718 to begin with and I've heard a few of them on the air from folks I know and it sounds just like their voices do in person.

I'm also experimenting with a single transistor preamp for a desk mic I'm building and the element from the old HM-103 might go into that if it works out ok.

Mick - W7CAT <snip>

On another note, if you have any old cordless phones lying around you can salvage 2 condenser mic elements from each one. One in the handset and one in the base for the hands free speaker phone. I've used these through the years as replacement cartridges and always get good audio reports with them. You can also get them from old defunct digital cameras or old video cameras.

I think it may be as simple as looking on the back and seeing if it says "Made in Japan" versus "Made in China." It is the latter versions, made in China, that reportedly give the problems.

My 7200 was made in 2009 (probably latter part), as I took delivery from HRO in early January, 2010, as I recall. As I recall (not in the shack at the moment), the HM-36 that came with the 7200 is one of the Chinese versions.

I have two of these "knock-off" microphones. The DTMF has quite audible processor noise in the background, & the audio quality matches the price. Apparently the audio quality can be improved by changing the capacitor inside, but I have not done this to mine yet.

Just like the old saying "Beauty is in the eye of the beholder," perhaps "good audio" is relative as well.

Common audio reports on the HM-36 mic made in China are that it's "muddy," at least on the 7200. That's what the local ham with the 718 and the Chinese HM-36 sounded like before he did the mod on the mic.

However, gain and comp settings can perhaps make up for some of the problems, what are yours?

I suppose there could be variances in build quality with different runs, so you may have just "lucked-out" on yours.

If it works for you, great, keep it; others have had a different experience.

Just like the old saying "Beauty is in the eye of the beholder," perhaps "good audio" is relative as well. <snip>

Well, just like I said before. Some of the guys I talk to use a lot of outboard audio processing and their audio sounds like they got their heads and microphones down in a 55 gallon drum and I think it sounds like crap but they like it. So maybe my mic sounds like that and its something they like. Now that I have replaced my HM-103 on the 706, I might use the element from the old HM-103 and put it in the HM-36 for use on the IC-718 in hopes that it will get great audio. Everyone always comments how good the audio is on the 706, so maybe the element change will improve the 718 - time will tell.

The best way to test audio is with someone who knows you or is used to talking to you or devising a way to record or listen to your own audio which can be challenging.

I've decided the best hint of good audio is NOT having to repeat yourself.

How many times have you heard good audio reports on the air and wondered, how can they say that?

Of course, unsolicited good reports are good too.

# 21407. The MDSR Team release a new Spectrum Analyzer Software

Yahoo group: ic706 (2010 — 2015)
Date: 2015-03-13 04:56:33 UTC
From: alexschwarz237@...
Topic: 21407  Message: 21407

Hi Everybody;

The MDSR team has completed a new software development. This time it is a new spectrum analyzer with a twist.
We have developed a new SAC (spectral amplitude correction) feature for it and it allows to correct the displayed spectrum to a flat display by correcting the filter skirts amplitude. A totally flat spectrum results, just as you would expect from a professional grade instrument.
See the link to the PDF manual for how it is done and how you can upgrade your transceiver.

Hi.
My old IC-706 serial number 12857 is not powering up when I pres power button. I can hear the clik from the ralay and the fan starts up for a second. But no life Display, and no speaker sound.
All fuses are okay.
Have any tips on what I should begin and scheck to find fault?
Or can anyone recommend a service company or a person who is good at 706!
Thanks for your feedback.

Remove the front panel and clean the contacts lightly with a pencil eraser.

The radio is very sensitive to bad connections to the front panel

Sounds like the same problem I had with my 706MKII only on the HF side.
Diagnosis was a bad PA unit. Good luck finding one of those at a reasonable
price! I ended up buying another radio, Yaesu FT-450D and love it.

From: Robert Duck VK2VRD
Topic: 21414  Message: 21414

My IC70k-MKIIG has started behaving strangely.

When the radio is in the receive mode the output from my speaker sounds normal for 160m, 80m & 40m. When I go to 20m (and I think all bands above) the received audio is very high and scratchy.

If I change the mode to CW the audio seems to be what I would expect on USB.

I am assuming that the output on transmit is the correct mode as I have been able to make contacts on the band and no-one has advised me that the signal is unreadable.

Has anyone had a similar problem or can point me in the right direction to overcome this problem?

The old QST magazines from that era probably have a little "blurb" announcing the introduction of the 706; the full product review would have been published some time later.

Major amateur radio products/advancements tend to get announced/introduced at Dayton. Maybe a safe bet to assume that's when it was?

I have two problems with power connectors for my 706 and 706 Mk II.

On the 706 Mk II, the part of the radio power connector that has the locking wedge on it has broken off. The power cord will no longer lock. Icom has the connector block available, but can’t tell me where to get an extraction tool. Does anyone know a source for the proper extraction tool? Are there any other sources for the nylon connector housing? Icom doesn’t have anything available except the housing. Are there any sources for the pins that go into the connector on the radio?

I bought an alleged Icom power connector at a hamfest. It is apparently a generic Molex with the wrong size pins. Is there a source (other than Icom) for the correct size pins? They may be the .084 Molex pins, but they are not the .093 pins.

Thanks,

Al

Thanks Dave. I fixed the MkII by cannibalizing the original 706 since I need to send it off for an HF/VHF switch problem repair.

I think I have found Molex equivalents for the pins, and maybe the cable connector but I can't find the radio nylon block. I'll try your suggested sources.

Ok, here is what I did:

Ordered the nylon/delrin/whatever block from Icom

Found the .084 pins and sockets on eBay

I'll post when they come in to confirm that it works, but I measured the pins in the radio connector and they were .084, so I am hopeful.

I definitely agree with the endorsement of Matt Adrian, who operates SAR Technical Services, Inc., the ICOM Authorized Service Center in Michigan (although it is his own, independent business) for good work. In the past, he has worked on my IC-706, IC-706MKII, IC-7200, and my AH-4 autotuner.

Unfortunately, and apparently due to changes in ICOM Policy and provision/supply of parts by ICOM, the only 706 model his shop can now work on is the IC-706MKIIG.

I tried to send Matt an IC-706MKII recently for repair for my 82-year old "Elmer," and Matt reported the above policy.

From: vk3pr@...
Topic: 21430  Message: 21430

Had my 706MK11G for yonks and a 706 before that. Never tried the VOX but have on my previous ICOMs. My original microphone died and I am now using an HM-154T.
I tried VOX with all the parameters correctly set (and all other variations) with no transmit. Is it my fault or has the comparator or some other function/component died?
I was intending to use it for Free DV but will use Signalink and the 13 pin port if it is not due to operator failure.
Help appreciated.
Stewart.

Hi Group!
I sent the radio to Amateur radio service in South Carolina.
Paul, the owner, called me the day after he received and told me the radio is not worth the repair and suggested me to sell it as it is.
I'm now looking for a used radio to install on board my sailing boat.
Being the radio my only mean to relay my position ashore and have weather forecast it is something I really need.
Where is the best place to look for used radio??
I was happy with the 706!
There are other similar radio I should look at??
I need something that is open to all frequencies and that doesn't cost a fortune.
Thanks for your help!!

Topic: 21434  Message: 21435

Well, there's a number of variables in what you are trying to do that you don't mention, but the setup sounds similar to the 706 setup for soundcard digital modes (which I run on a 706 with a Signalink).

Are you getting a TX indication on the 706? If not, that is why there is no power output

In addition to the cable connecting the Signalink to the computer and the cable connecting the Signalink to the 706 (13-pin DIN ACC port on back), I also have to have a USB/CI-V cable connecting the 706 to the computer.

That maybe why you are not getting the TX/power output on the 706.

On the other hand, if the Signalink link IS keying the 706, and there is a TX indication on the rig, there may be no power output because the sound card level for the Signalink is set too low in either (1) the "free DV software or (2) the soundcard manager (in either the DV software or the computer) managing the levels in the Signalink.

I see them on Ebay quite often. They often sell for more, but sometimes less, than original retail.

I might bne wrong but I think you can substitute Cat5 cable for the separation. personally I use velcro to mount the head to the dash. would that work for you?

CAT5 doesn't have the correct connectors!! The connectors are proprietary ICOM ones that can't be bought off the shelf. You have to remember these radios have been out of production for over a decade so getting new accessories is virtually impossible!!

I would like to connect an Asus netbook to an Icom 706 MKIIG to download weather fax.

The asus has the combo jack and the Icom I believe is stereo.
I believe so because the radio came with a little bag that have two TRS (1/8 and 1/4) jacks inside but maybe is balance
□□

I looked to buy something already done but I didn't find anything.
So I demounted a headphone with mic for an old phone.
Stating from the tip is the + left speaker, than + right speaker, the common - and the sleeve is + mic.
How should I solder them on the Icom side that has 3 electrical connection ??

The mic wire just to the tip and the negative to the sleeve??
Or to both??
It will work???

Thank you
R.

Robert,

So you're just looking to pass the audio from the 706 to the Netbook in order for the software program to decode the transmitted fax tones into a fax image on screen? (Pardon the elementary statement but wanted to make sure that you are not talking about CAT control, or other advanced functions associated with soundcard digital ("SCD") modes, etc.)

I have "experimented" with monitoring and copying SCD transmissions by plugging an audio extension cable into the 1/8" headphones jack on the 706 control head and plugging the other end into the mic jack on an ASUS laptop. The audio cable has 1/8" plugs on each each which fit the jacks on the control head and the ASUS mic jack.

I copied the SCD transmissions with FLIGI running on the ASUS laptop and it does copy the tones with the wiring I described. Not as good as running it through a Signalink, for example, because there is no filtering, etc., it's just raw audio.

I think I got the audio extension cable at Radio Shack (one of the things they DO carry for hobbyists!), and it's probably a stereo cable, but didn't seem to make a difference. No soldering required!

So that's what I did that sounds similar to what you have described, if I understand your goal correctly.

Hi Larry and all.
I would like to use jvcom32 to download weather fax.
Here is a list of the frequencies to use if anybody is interested

http://www.nws.noaa.gov/om/marine/rfax.pdf

The problem is that the little asus netbook have a TRRS jack like the phones instead of the two separate audio in / audio out jacks on other PC.

The Icom have a TRS connector so I have now two wire coming from the computer mic + and - and 3 pin on the Icom jack and I was wondering where to solder them.
I know the - is the sleeve but I don't know if the mic need to be connected to one or both ring....

I just soldered to both but I didn't test yet.

For the TRSS I canibalize a cheap headphone. I'm wondering if the wire will be sturdy enough for the signal.

As you can understand my knowledge in electronic are really really bad!!
Thanks for the help
R.

OK, sounds like you're talking "apples to oranges" compared to my experience with the ASUS laptop/notebook.

But apparently, you do need to take the audio output from the 706 and get it into the netbook, although you didn't exactly confirm that.

I am totally unfamiliar with the "TRRS jack" nomenclature, but it appears that AMAZON.COM carries a "TRRS Adapter" which may do what you want. Just go to AMAZON.COM and enter the search term "TRRS jack."

Or, like you are trying to do, you can build a cable with a 1/8" plug on one end to connect to the audio/headphones jack on the 706 control head, like I did, and build up your own TRRS plug on the other end to connect to the net book. If you come off the 1/8" audio jack on the control head, then your choices as to where to connect and solder for the audio are limited. However, you mention the "3 pin on the Icom jack" which would involve either the ACC port on the back panel, or the RJ45 mic jack on the control head, and I don't see how either is required if you simply take the audio from the 1/8" audio/headphones jack on the 706 control head.

Another choice is if the netbook has a spare USB port, buy one of those cheap USB external sound cards, plug it into the netbook, and then it will give you "audio out" and "mic" ports, just like on a standard PC sound card.

Regarding the separation cable, they are proprietary Icom connectors. I don't think you will ever be able to find them. Look on eBay and other sources for the cable kit, but they can be pricy because they are getting hard to find.

Way back when I bought my 706, Icom was giving the separation kit away as an incentive. You may be able to find someone who got the kit for free, but never used it. If you know of anyone who uses a 706 as a base station you might ask them if they have the separation kit. Lots of hams got the kit because it was free but never used it. If they can find it, you may be in luck.

Yes, I need to take the audio out from the Icom and feed the netbook.

I made some tests and buid two cables.
One 1/8 TRS (Icom) to 1/8 TRRS (asus)
And the other ACC to 1/8 TRRS (asus) using pin 2 and 12

The advantage of the ACC connection is that I can hear and tune the frequency while the computer is receiving, while if I connected to the front jack (headphone) I cannot.

Thank you for your inputs!

Yes, I have used the WINMOR Soundcard Modem/TNC [1] with RMS Express, both part of the Winlink 2K system, with my "original" IC-706.

I use it with a Signalink, which is probably recommended for best results.

There are Yahoo User Groups for both Winlink 2K and WINMOR which are probably better suited for posting and getting answers to your technical questions on Winlink/WINMOR than on this group. There have been a number of users on the Winlink 2K and WINMOR Yahoo groups who use 706s and can provide more technical details.

See: https://groups.yahoo.com/neo/groups/WINMOR/info and

https://groups.yahoo.com/neo/groups/Winlink_Programs_Group/info

There are at least a couple thousand members in each group.

What else?

Larry J. Ford
K4AEC

[1] You don't use WINMOR, by itself as a stand-alone program; it's generally used in conjunction with RMS Express, which serves as the "front-end" for message creation (think "Outlook Express") and handling, and WINMOR is used as the HF connection via the radio to connect to an RMS ("Radio Message Server") in the Winlink system.

e.g., "WINMOR is an HF digital protocol designed for use with the Winlink 2000 network. WINMOR provides an alternative to external PACTOR hardware.

WINMOR is protocol that works with a PC sound card to provide a virtual TNC enabling throughput performance approaching h/w based PACTOR 2 and, hopefully, PACTOR 3.

RMS Express is the preferred Winlink 2000 (WL2K) radio email client."

Assuming that "...cat cbla connection ..." means "CAT Cable Connection" as in computer control from the PC/software to the radio, I use a Valley Enterprises CI-V to USB converter cable, with an FTDI chipset (avoid anything with a PROLIFIC chipset, the changes of getting a "counterfeit" chip are high), that I got from AMAZON.
See
http://www.amazon.com/Valley-Enterprises-Chipset-Two-Way-Programming/dp/B004L0T4UM

Works like a charm.

That's in addition to the USB cable from the ASUS laptop to the Signalink external soundcard/interface, and the cable from the Signalink to the 13-pin DIN Accessory Port on the back of the 706.

If you, as you stated before, are going directly from the radio audio In/Out connections to the netbook audio in/out, then you would not have the hardware and cables mentioned in the preceding paragraph.

You might ask the folks on the Winlink and WINMOR listserves about the viability of going directly from the radio audio In/Out to the netbook audio in/out. Pay particular attention to anything posted by Rick Meuthing, who wrote the WINMOR software and who helped write and set-up the Winlink system.

Thank you Larry!
Exactly what I was looking for.

I start posting on winmor.
My understanding is that a radio to PC connection is possible but a isolate interface is always recommended and a USB signalink often suggested for better result
Same for the CAT cable. If is not mandatory has been suggested by more than one sailor to simplify the connection while the boat is sailing(moving).
Thanks again

Robert wrote: " My understanding is that a radio to PC connection is possible but a isolate interface is always recommended and a USB signalink often suggested for better result. Same for the CAT cable."

Well, there is quite a bit of debate on both points.

First, regarding the "direct audio to audio" connection (i.e., directly from the radio's audio output/input and vice versa), if you do go totally "direct" then you are relying upon the spectral purity and performance capabilities of the sound card found in your PC/laptop/notebook/netbook. Bear in mind that the brand and model of sound card built into your netbook was likely chosen on the basis of cost, rather than performance.

Also, with the "direct" method, there is no "isolation," so some rather strange things can happen with regard to noise, RFI, ground loops, or any number of causes. An intermediate step is to use the internal sound card, but to build an "interface" which inserts some relatively low-cost audio isolation transformers between the PC and the radio. There are a number of schematics and kits that are (or were) available on the Internet or in QST (Skip Teller's being a prime example of the kits). This helps, but if you've got a poor performing sound card in your netbook, you're still stuck with it.

Finally, using an interface which provides both isolation AND a high-quality sound card, like the Signalink USB gives you the best of both worlds, but at some added cost and a bit complexity (e.g., some additional cables). WINMOR is a rather demanding bit of software and to get the best performance, Rick Meuthing, the program's author, recommends use of at least a Signalink sound card interface over the typical sound card found in the typical PC.

Secondly, if you do not use a CAT control cable, such as the CI-V to USB cable I mentioned, then you will manually have to set the radio frequency and figure-out the PTT method. RMS Express/WINMOR can handle that if there is a CAT control connection between the PC and the radio.

You mention sailing. Rick Meuthing (and others) developed the predecessor to Winklink/RMS Express/WINMOR, a program called "SailMail" because he (and possibly the others) were sailors and wanted to deploy a viable "e-mail by HF radio" system on board. If you are planning on doing what I think is called "blue water sailing" then I think Rick would be the first to tell you that you need to go beyond the "direct method" in order to have a reliable system, regardless of what the "simple folk" tell you, especially if your life is going to depend upon it! (Now, if you are planning on having a SAT phone on board, then that's a horse of another color altogether!)

73,

Larry J. Ford

Larry,
I'm 100% agree with you.
And I purchased a signalink usb + the CAT cable you suggested.
I know airmail/sailmail BUT the price of the pactor modem....
Winmor (with 130$ in parts) looks like a interesting project !!

Thank you for your email.
I will keep you and the group update!
R.

Well, Pactor comes in various "flavors" (speeds) and you get what you pay for when it comes to speeds and robustness.

Pactor I, the original version (and the slowest) was bundled with a number of TNCs (Kantronics KAMs, etc.) back in the late '80s, early '90s, many of which can be had at hamfests for $50.00 or so. Unfortunately, a number of the Winlink System RMSes no longer support Pactor I. I used a Kantronics KAM with an upgraded chip and firmware for NTS Digital purposes on Pactor I for a year or so and it worked just fine for receiving and sending digital Radiograms through the NTS Digital system.

For Pactor II or Pactor III (III being the fastest currently authorized by the FCC for use in the US amateur bands), those modes are proprietary to SCS, and you either have to buy a new or used SCS Pactor modem to gain access. I bought a used SCS PTC-II USB modem with an installed Pactor III license from a sail boat owner who didn't need it any longer. Not exactly "cheap" but a lot less than a new one!

WINMOR is faster than Pactor I under most conditions, but not as fast as P-III. I do think the SCS modems can work to pass traffic under propagation conditions that would cause WINMOR to fall by the wayside because the SCS modems have dedicated, on-boards Digital Signal Processing units in the modems (a "hardware" solution), whereas WINMOR relies on the computer software and computer's CPU for the DSP functions. Generally, a dedicated hardware solution will beat a software solution that has to compete with other, internal PC functions for processor time.

Just my .02 worth!

# 21461. 706 mkiig "Project" - won't turn on, one of the finals gets warm, pulls 2.5a while off

Yahoo group: ic706 (2010 — 2015)
Date: 2015-06-02 14:41:03 UTC
From: nbergevi@...
Topic: 21461  Message: 21461

Just picked up a used 706 mkiig "Project" radio. Knew it won't turn on when I picked it up.

Tore it apart and found one of the traces on the underside of the PA board next to Q172 / C243 / C244 was burn out. I jumpered it with a piece of 22ga wire and put it back together again.

Wouldn't power up, but I noticed the power gauge on my 12v battery pack dipped from 74% to 58%. I plugged put an amp meter inline and saw that it was drawing ~2.5A while off and noticed that Q172 was getting warm / hot when power was applied even with the 4A fuse disconnected.

Does this denote that the finals may be blown, or is there a short or relay somewhere else that may have gone bad and is shunting all power away from where it needs to be?

I dont have a schematic handy but of the fuse is out there cannot be too many places the current can go. I did hear about someone once had bad filter capacitors right on the dc supply. Its not carved in stone but if the finals were shorted it would draw a lot more than 2A. Also bear in mind that there may be more than one snag but I would get a schematic and see where q172 fits into the scheme of things. Dave ve1day Sent from Samsung Mobile

# 21463. Has anyone tried to mod the new finals instead of the PA board?

Yahoo group: ic706 (2010 — 2015)
Date: 2015-06-02 17:03:18 UTC
From: nbergevi@...
Topic: 21463  Message: 21463

This may seems like a silly question - but has anyone tried to mod the RD70HHF1 / RD70HVF1 instead of modding the PA board?

Isn't it just a bit of heat sink material that we're dealing with? I would imagine that since the finals are already thermally attached to the chassy that removing a sliver around the edge with an angle grinder / Dremel wouldn't effect thermal dissipation much. If there did need to be some modding to the PCB it would just be around the center solder pad, which seems it would be a little more forgiving than widening the pads on the sides (which requires tweaking with some traces and components).

... or am I missing something here?

Dave is right. Check for shorted caps or resistor in the circuit. I would think some other component besides Q172 might be getting warm as well.

I pulled the SRF J7044 that was heating up, and now it isn't pulling any power when it's off, but it also isn't turning on.

Would having one of the finals removed keep it from powering up, or would that be something else?

- Noah

I pulled out the srf j7044 transistor @ Q174. It was shorting out between the drain and gate. It isn't pulling any more current connected, but it still isn't powering up either.

Should the radio still start up with one of the finals removed, or would that block current from reaching the control side of the radio?

I ordered one of the new RD70HVF1 finals and it should come in a few days. Interesting to see what it will look like once I've put it in place.

On a related note -- any reason I can't grind down the heat-sink until it fits into the existing slot?

- Noah

Looks like you are on the right track. Any tranceiver circuits I have seen has not had the power for the rest of the radio directly powered from the final output stage. True that power goes through that board so you still have another issue with it powering up. You should be able to trace it through with your multimeter. The power has to be switched somewhere and there has to be a regulator somewhere that will supply power to the front panel all the time that will signal the microprocessor to turn on the rest of the radio when you press the power button. You can get one made by Icom for over $ 100 or try something like this one on ebay for under $ 20.  You could build your own if you  have a serial port instead of the usb port. Not much in them and Icom charges way too much.
Ebay number.

I used an FTDI USB to 5V TTL converter, tied the RX to TX and to the tip of a 3.5mm mono plug, the GND to the sleeve, and it works just fine. You can use any USB to 5V TTL converter but personal;ly I'd stay away from Prolific, I'd prefer FTDI or Cypress chips, (which also bring out the RTS/CTS to use for keying). YMMV

Hi Everybody;

The MDSR Team has released the “New MDSR Spectrum Analyzer V1.1”
Our team has put in a lot of work to make this release as user friendly as possible.
Updated in the new version V1.1 · New line decay mode: double spectral lines in “decay-line mode”.
· Input Audio selector: allows to select the left, right or both input audio channel
· Storable correction curve files: correction curves can be stored according to band
· Spectrum analyzer remembers last settings: for easy startup without calibration
· Updated graphic user interface

We also have updated the manual and came up with an easy way to use a RF broadband noise generator (MFJ-5014) to calibrate the filter correction curves so the displayed spectrum is absolutely flat; once the curves are stored on the hard drive the noise generator is not needed for operations.
Note: The Manual is part of the setup procedure and can be found in the “MDSR” folder. The file name of the manual is “Java SA Software Manual V1-1.pdf”. If you have trouble locating it you can always search for it.

Download the PDF manual directly from our file server:

# 21478. Ic706MK2G Receive cut outs

Yahoo group: ic706 (2010 — 2015)
Date: 2015-07-22 11:07:59 UTC
From: luminosity@...
Topic: 21478  Message: 21478

Greetings from Vermont
My rig seems to have an intermittent heat problem where the receiver goes mute,
often when the fan kicks in, and then comes back fine when it cools down for a while.
I can also coax the rig back into normal receive when turning the power button on and off.
Does this symptom suggest a component that has failed that is common place to this rig?
Thanks/ Barry / N1QWA

No such problem in Texas heat.

I have no idea but a question comes to mind. Is it receive or audio? Or does the S meter go dead as well?

I assume you've checked the squelch setting.

73
Mike R

Find me on "Zello", a walkie talkie or handi talkie type app. I'm listed as KE5GBC. I'm mostly on late at night.

# 21481. Intermittant Noise on RX and TX on 70cm FM

Yahoo group: ic706 (2010 — 2015)
Date: 2015-07-26 18:51:19 UTC
From: Derek G8ECI
Topic: 21481  Message: 21481

As anyone experienced, what I can only call a noise very similar to the Hiss generated by a Super Regen Rx on 70cm FM, it manifests itself at any time and is also noticeable by the qso partner when I am transmitting. The 706 is a MKIIG, now around 16 years old. It was used for quite a while and now is used daily whilst mobile. The noise is only apparent on 70cm FM, it as never shown up on 2m or 6m FM, or any other modes or bands. It seems to start a a low level and then builds up until it stops, which makes me think it's something going into oscillation?

Any ideas or has anyone else suffered from this.

From: g8eci@...
Topic: 21409  Message: 21482

I had that fault years ago, I took it to ICOM UK and for approx $50 later it was working, it had something to do with a Power regulator having an inadequate heat sink and it burn up a PCB track, they repaired the track and put a bigger stick on heat sink pad under the regulator, but where and what device I do not have a clue.

I think it must be a fairly well known problem though, so maybe worth giving your local ICOM supplier a call.

Icom 706 MK II G sporatic noise TX and RX
http://www.eham.net/ehamforum/smf/index.php/topic,43430.msg298025.html#msg298025
« Reply #7 on: August 07, 2008, 02:24:26 PM »

I've seen several 706's with symptoms as you describe. And it was due to one or more VCO trimmer capacitors becoming unstable.

There are 4 of trim caps:

C4: Reference VCO
C306: VCO1
C335: VCO2
C367: VCO3

If only 2 & 6 meters are affected, suspect VCO2.

Sometimes, giving the offending trim-cap a few twists, then realigning, will solve the problem. But often, the trim cap(s) must be replaced, which is not an easy job, since they are surface-mount types located inside tiny metal shields.

Look closely at the ribbon cables. They don't always go in exactly correct.

You may need to move them slightly left or right to line up the
connections. You'll probably need a magnifying glass to see them.

At least that's what happenned to me.

# 21497. 706 jumps back into tune?

Yahoo group: ic706 (2010 — 2015)
Date: 2015-08-23 15:21:24 UTC
From: Ron Lawrence W4RON
Topic: 21497  Message: 21497

I have a question for the 706 experts in the group.

I have an original IC-706 that I'm running in my mobile.
I have one of the plugs that lets the radio go into tune mode
when you press the tune button on the front panel.
I have a Daiwa cross needle SWR/Power meter between the radio
and the Pozy screwdriver antenna that I control with a center
off up/down switch.
I can tune the antenna so that the SWR is flat, but when I transmit
sometime (most of the time...) the radio will jump back into
tune just like I'd pressed the tune button. Most of the time I
can press the tune button again and it'll work alright for a while
but then sometimes it'll jump back into tune again.
It does it mostly on 20 meters, but every now and then it'll still
do it again.

Does anyone have an idea what the cause of this is.
I sure makes it a pain in the butt to use it.

cheers

From: LARRY J. FORD
Topic: 21499  Message: 21499

First, check your "TUNE" settings in the SET menu (not QUICK SET) to determine whether you or someone else previously enabled the setting that causes the 706 to tune automatically.? It could be that as you transmit, something in your feedline or Ron Pozy's clone of a Screwdriver Antenna is causing the SWR to rise and triggering the TUNE response.

If that is not the case, perhaps one or more of the (few) components which comprise the typical "ICOM tuning modules (plugs)" has gone bad, opened-up, etc.

Try swapping it out with a known good plug (or build a new one yourself using one of the many designs available on the Internet), and see if the symptom persists.

Here is what the manual says about auto tune:
27 A-TUNE STRT (auto tuner start)The optional AT-180 ANTENNA TUNER has an automatic

start capability which starts tuning if the SWR
is higher than 1.5–3.When “oFF” is selected, the tuner remains OFF evenwhen the SWR is poor (1.5–3).When “on” is selected, automatic tune starts even

when the tuner is turned OFF.
Note: Even when “on” is selected, automatic tune

does not start for the 50 MHz band.
Auto tune function OFF(default).Auto tune function ON.

  I didn't know there was any setting for "TUNE" in the
menu.
What should be the ideal setting for it.
I've been running it in my mobile for 3 years now.

Thanks

The action that you are describing sounds like you (or a predecessor owner) may have enabled the "PTT Tune" function.

Since you said you're using one of those "TUNE PLUGS" which I believe are designed to emulate the AH-3/AH-4 series of external auto-tuners, then in Section (Chapter) 7 of the Owner's Manual for the IC-706 (original version), on page 44, SET MENU ITEM 13, "PTT TUNE," it describes what that setting does, which is very close to your description, particularly if you have an issue with your feedline and/or antenna that would cause SWR to rise.

You need to go into the Initial SET mode of the radio, check ITEM 13 and determine what it's set to.? If set to "OFF" (which is the setting I use), then the Tune function is completely manual and operates only when the TUNE button is pushed.? If it's set to "ON" then it can and will tune on TX if the SWR is too high.

If ITEM 13 is set to "OFF" then you have another issue and others have offered "fixes" such as making sure both the radio and the antenna are well-grounded to the vehicle body.? Also, check the feedline between the radio and antenna and control cable from the remote control head to the radio chassis for cuts, nicks, etc.

Also, the Tune plug may be bad, or there's an issue with the antenna.

So in theory it should be possible to emulate the control head on one of the involved computers.

But I realize "Nothing is impossible to those not carrying it out themselves"
(A quote that I usually dedicate to my XYL ;-) )

I have two problems here. One is I can't get the MB-63 bracket off (I got it on but note there is a warning about clipping it on backwards!). If I have to I'll live with it permanently mounted.

But what about the little white switch on the right side side (facing from the back)? What does it do and which is the correct position (up or down)?

Thanks.

Gary,

I know that an incorrectly installed MB-63 bracket can be removed because I did it on a rig I acquired years ago. Unfortunately, it is too long ago to remember how I did it. I don't recall that it took much effort of ingenuity. Look at the diagram in the manual and you will see how it is attached. That should help you visualize what needs to be done.

The switch on the back of the control head changes the front panel audio jack between headphones and an external speaker. I don't recall the position for either use but I believe it is marked.

# 21513. Icom R-70 Advice

Yahoo group: ic706 (2010 — 2015)
Date: 2015-09-05 15:40:52 UTC
From: David Stinson
Topic: 21409  Message: 21513

I know this isn't an R-70 forum, but the R-70 group has been
dead for over a year and I'm hoping someone here can point
me in the right direction.
My R-70 receiver display and encoder operate correctly,
going up and down in frequecy normally.
However, the frequency displayed is often not the frequency
to which the radio is actually tuned.

For example, on 40 meters:
Displayed Actual
7002 7063
7015 7065
7020 7065.5
7035 7067

At 7075, it tracks normally until about 7125, then swoops
to 7166.5 and continues the ".5 KC move for 5 KC displayed"
behaviour.

On 20 meters:
14290-298 tracks normally.
Switch to 299 displayed and it is actually on 14359.
Displayed Actual
14099 14160
14398 14398
14399 14460

I have the service manual; this is likely a hung bit
somewhere. I can puzzle it out over a week but
I'm hoping one of you folks has seen this before
or knows someone who has.

Thanks for your patience,
73 OM DE Dave AB5S

you should take care to use the twisted pairs of CAT5 accordingly. Dont know the max. distance.

1 is a power on/off control, could pair with 3
2 is ground, could pair with 7
3 has 12v and TX audio
4 is ground, could pair with 8
5 is RX audio, could pair with 6
6 has 12v when set is on
7 is display data
8 is control data

If I'm not using the tune button, I usually use rtty, just seems less steps and should generate less emission with a much narrow signal than Am. I used to use am many moons ago but you need to reduce power anyway so AM really no advantage.

"Doesn't the rig automatically shift to CW and drop the power to 10W?

Kurt "

Yes, it does, IF you have one of the specified (in the manual) ICOM external tuners (e.g., AH-x series) attached to the 4-pin tuner connection on the back of the rig, or a third-party tuner that "emulates" one of the specified ICOM tuners (e.g., MFJ-998, and lesser variants).

There are also the "Tuner Plugs" out there for sale (or that you can make yourself using the proper Molex-style connector and properly valued capacitor and resistor), which "trick" the microprocessor in the 706 into "sensing" that an ICOM tuner is attached.

In either of those cases, the rig will respond as you describe above when the "TUNE" button is pushed.

If you have nothing attached, or a non-ICOM tune attached, it will not.

# 21522. 706 separation kit?

Yahoo group: ic706 (2010 — 2015)
Date: 2015-09-19 05:34:58 UTC
From: Ron Lawrence W4RON
Topic: 21522  Message: 21522

I have an original 706, not Mk2,
I wonder if it requires a separation cable made just
for this radio or will any 706 separation cable work?

Now for the real question, does anyone have a separation
kit laying around they'd like to see put to a good use?

I just bought me a Dodge Caravan to replace my '91 Buick PA
that I wrecked a few weeks ago. The mounting system that
I used in the Buick won't work in the van so I have to
build something new and I think being able to mount
the head up where it's easier to use would be the ticket.
The way I had it mounted in the old Buick I could rest
my right arm on the center armrest and my right hand would
just lay right on the 706 tuning knob. I hope to build
a mount that'll allow me to do this in the van. I don't
want a mount that requires me to reach for the know.
I do too much tuning around on HF for that to work.

Thanks a bunch guys.

Heil makes a specific headset for the 706 (that plugs directly into it) because of its need for a fairly high input level at the mic jack. Is this an Original 706 or a later variant? There is a trick that can be done to overcome that using the compressor, but we need to know which variant you have.

About adapters, if Heil doesn't make one, it shouldn't be too hard to build one. All you'd need is an RJ45 pigtail and a couple 1/8" female connectors.

From: mm0cxa@...
Topic: 21529  Message: 21529

Hi all

This is the first time I have posted on this group and hope that someone can help me. I have just pruchased a 2nd hand Ic 706Mkii with a fault on the frequency dial. When you turn the dial the frequency will change for about two or three digits and then, even though you keep turning the dial nothing happens. It just jumps back and forth between 2 numbers - 5 to 6 and back again, that sort of thing.
Might make me sound like a right numpty but I had one of these radios before and really enjoyed using it. Would like to get this one sorted if I can.

Cheers

My IC-735 had the same problem. I used a dual trace scope and verified that the encoder pulses were getting processed wrong. I took the encoder apart and cleaned it. There was a lot of dust in there, but that didn't fix the problem. I then noted that if the radio was left on for a day or so the problem went away. The current working theory is that there is a bad cap or some other component in the immediate vicinity of the encoder that is changing as the radio heats up or as voltage builds up on a defective cap. I have not yet taken the time to try to find the defective component.

check for a bad or cold solder joint near or at the encoder
It may be changing as the radio warms up.

Andy: I had a similar problem with my PRO 3. The VCO shaft is worn ( not really the shaft, but the soft zinc housing). You can replace the VCO or adjust the existing one. The aluminium cover needs to be removed by bending the tabs. The three or four connections for the PC board need to be unsoldered and the board removed. You can then see how the pickup is adjustable so the clearance to the "wheel" set. I would suggest a complete disassemble and cleaning of the shaft and housing be done. Lubricate with a good quality synthetic motor oil (0w-5w) sparingly (!) I wish I could tell you an exact clearance dimension, I just moved mine a "smidgen" and mine works fine. The worn housing with the right lube gives the tuning knob a nice light frictionless feel, which I like. Good luck with it, if you need more you have my email address. I might be able to send pictures. Good luck, Paul, KJ4AMH.

# 21535. Re: [ic706] Frequency readout jumping when turn dial

Yahoo group: ic706 (2010 — 2015)
Date: 2015-10-06 18:12:30 UTC
From: LARRY J. FORD
Topic: 21529  Message: 21535

As others have posted, encoders are apparently available, or bench repairs may solve the problem.

As to how "easy" either would be, I defer to others, but would have to say it may depend upon on handy and confident you are in your own abilities.

For me, an encoder replacement or repair would mean the rig is making a trip to my favorite ICOM technician's shop, Matt Adrian owner/operator of ICOM Service Center Mid-West in Michigan!

I can do basic soldering and the like (over the weekend, I de-soldered the lithium back-up battery in my 82 year-old Elmer's old TS-50, and soldered in a new one), and have built a few kits, do some basic trouble-shooting, etc., but anything "mission critical" that has a chance of bricking the rig is going to a qualified shop.

Hi Everybody;

The MDSR group has participated in the TAPR conference in Chicago last weekend, where we besides of presenting a paper also announced the latest version of the MDSR software.

The new version also contains the new spectrum analyzer integrated into the MDSR software. This allows new features such as scrolling frequency marquee and highlighted IF pass window. All in all the new addition to the MDSR software makes it absolutely essential to upgrade to the new version.

The new version can be downloaded from the MDSR website in the download section.
http://users.skynet.be/myspace/mdsr

To find out how to turn your rig into a IF SDR using the LIF2014 kit and the MDSR software go to our website and download the specific transceiver mod PDF file from there. I you can not find your rig in the listings join the MDSRadio Yahoo user group and browse through our files and pictures.

All the best and 73;

The MDSR Team

From: sm6ehy@...
Topic: 13442  Message: 21541

Hi,
just had an accident and destroyed my rotary encoder also.
ICOM still does not have a replacement.
The manufacturer of the encoder ALPS does on the other hand have replacements for this 916G !
I just installed an ALPS STEC16B03 encoder with 24 pulses per turn in place of the original.
Crossing 2 pins corrected the bilateral pulse chain in both directions.
Underside view the pins are (left to right) A -B - C.
The working pin config for IC706 is B - A - C.

The cost of this mechanical electric encoder is some US$ 3.
The obsolete ICOM part was priced at US$ 71.

The most recent product catalogue from ALPS indicate that the used STEC16B03 is now made smaller and this new one is named: EC12E2430804.

Hi,
exchange encoders are available for the ICOM 706. The original was made by ALPS and named 916G.
The new replacement, which is a bit smaller in size, but fits very good is
ALPS EC12E2430804. This is the most recent issue and still in production.

Available from a number of distributors around.
The little older encoder family of STEC16B03 which is a bit larger than the EC12E... but smaller than the original ICOM type.
This STEC16B03 is for example available from Distrelec.ch / ELFA.se at a affordable price.

ICOM charged some US$ 70 for the original part, but these new substitutes can be found for US$ 3 !

Good luck with Your repair.

# 21543. Substitute VFO encoders

Yahoo group: ic706 (2010 — 2015)
Date: 2015-10-15 17:27:10 UTC
From: sm6ehy@...
Topic: 21543  Message: 21543

Hi all,
Quite a number of owners have experienced problems with the VFO-dial encoder.
This unit was made by ALPS and was marked -916G-.

Original spare part price from ICOM was in order of US$ 70...

The substitute I found is priced at around US$ 2.5 to 3.0 !

ALPS STEC16B03
or the most recent type
EC12E2430804.
The underside view of contacts on these encoders are (left to right) A - B - C.
To function in the IC706 two pins have to be crossed when connecting to the fronts circuit board.
The working order is B - A - C.
With 24 pulses per revolution the feeling of this new encoder is exactly like the original.

Gather that other ICOMs use the same type of encoders from ALPS.
Good luck with Your repairs,
73

# 21544. IC-706 intermittent cw

Yahoo group: ic706 (2010 — 2015)
Date: 2015-10-16 13:13:17 UTC
From: eaoxer@...
Topic: 21544  Message: 21544

Hello All,

Here's a strange one. Listening to cw there is an intermittent dropping of the tone which sounds like
you are listening to cw on am. This is kind of a raspy sound and not a pleasant cw note at all. Can't really predict when this will happen but usually in the middle of a cw qso and then it will go back to normal just as un predictably.

Any hunches, theories or guesses are appreciated. Anticipating a fix in time for cw sweeps.

Thanks and 73,

Ed, W8EO

# 21545. Re: Frequency readout jumping when turn dial

From: Andy Burns
Topic: 21529  Message: 21545

Hi All
I managed to source a new rotary encoder from Icom UK for the princely sum of £21.75 inc postage and VAT.  It was indeed this item that was causing my problem and, although I was a bit apprehensive, it turned out to be quite an easy fix.
The number on the rear of the faulty unity is 704G (made by Alps).  What I noticed was that from the casing to the 3 connections you can see 3 tracks.  On my new unit they show as 3 gold coloured  lines.  However, on the old one there is 2 gold and one black.  I don't know if this indicates the problem but it probably relates to something not being right.  I am going to split the casing and investigate further when I get the chance.73Andy Burns MM0CXA

I have a very vague recollection of something like that happening with ALC ( I think that's the setting) in CW and AM. Raspy and drops... I'm going from having done it once in the mid-90's, check ALC, AGC and NB, one of those can do it. From what I recall, something about the quality/level of the received signal would trigger this setting with a result like what you describe. Could be something else, but those are the first things I would check.

Larry,
I do not have a switch nor schematic but since the plug is a single circuit TR (Tip and Ring) type I suspect the PTT switch is just a SPST or DPST that shorts the Tip (PTT) to the Ring (ground).  Do you have reason to believe it is more complicated?

No, just wondering what it is, if it is something like you describe.? Nevertheless, I'd like to see it.? Heil Sound said they did not have a schematic they could send, which I thought was a bit odd.

Thanks.

Make sure the key or paddle is plugged into the correct jack and uses the right plug. Make sure the menu is set for key or paddle, whichever is being used.

This confused me too. Just thinking, what would happen if the radio had an optional filter, but someone removed it and forgot to set Mode 9 and/or 10 to no filter?

Also, check Mode 1 to make sure CW is not inhibited.

I would think that the CPU reset would have cleared these. ( While pushing ▲and ▼, push [POWER] key )

Joe

I have the IC-706MK2G. I do not know if your radio is the same way as mine. But to access the main menu in the radio.. With the power turned off, press down on the lock button and power button at the same time. This will activate the main menu, when you see the number one, Hit the mode button until it shows CW, if it says off then rotate the tuning knob to the right and it will say ON. Thn turn the radio off and back on and the CW will show up. I never did a full restore on the radio. Also as stated by some one else, If you hear CW sidetone with the key, make sure the break-in turned on...73-Steve

Anyone have an idea what would cause the AM broadcast band to no longer work with respect to being able to listen to the band. Has worked fine for years and suddenly stopped receiving AM , for a while it would not receive then if you left the rig on it would start to work-but now nothing and I am physically close to the local AM transmitter (mile away) so signal strength should not be an issue. I am thinking there is a relay? that is not connecting the band to the antenna port? Rig is a 'plain' 706 not a Mark II Appreciate any help hate to have to send it back to Icom for them to charge $100+ just to listen the local AM station when I want to hear the news. Thanks in advance for any and all help

What is the serial number of your radio? If it is a IC-706mkII you may
be out of luck if the final transistors are bad. Older PA transistors
are now unobtainable.

Look at: <http://jvgavila.com/ic706.htm> for serial # information.

Get in touch with Mike Nadeau N1EQ in Maine. Go to Mike Nadeau - N1EQ . He fixed mine at a fair price. On 440 the out put fluctuated between 12 to about zero watts. The output chip was bad..  He will let you know when to ship it to him. Every thing is on his web site, How to pack it, he uses ups and you print the packing slip off his web site. He gets a 5-star rating on eham. I gave him one.  73-Steve--WB2OEE

Matt in Michigan gets lots of good reviews but sounds like he may not do 706's anymore but worth a contact.

Mike in Maine gets recommended also.

Seems like there is a guy near icom in Washington gets mentioned sometimes.

Not sure about finals for the mark2 no g but it wouldn't surprise me if they are no longer available. I sold my mk2 for that reason and now have 2 "g's" with the Mittsubishi finals and a spare set of those.
I liked the mk2, it seemed to run cooler in receive than the g's.

Good luck.

Mike R

Find me on "Zello", a walkie talkie or handi talkie type app. I'm listed as KE5GBC. I'm mostly on late at night.

Excuse me, but the rig under discussion is the ICOM IC-706MKII, NOT the IC-706MKIIG.

The 706MKII DOES NOT have 440 capability and is no longer supported by ICOM or some of the independently-owned authorized service centers.

The 706MKIIG DOES HAVE 440 capability and is still supported by ICOM and its affiliated service centers.

How much power would the MKII put out without the PA?

I wonder if anyone came up with a mod to drop in one of those rectangular PA packages?

This is a rather common problem for the 706 original. There are some small coils below the power connector, which can get damaged if the power connector is plugged and unplugged a lot. I have had one with this issue before myself.

Yes, definitely "ouch" if you own an "original" IC-706 (NO "MK" designation) or its immediate successor, the IC-706MKII.

Yep -- me too.  When you open the radio, do it carefully so if they fall out, you'll be able to catch them and resolder them in place.  I moved them as far as I could from the power connector and never had the problem again.

I find it extremely sad that this information is corrrect, Checking the vast majority of the independent service crew they have De-listed The IC-706 and the IC-706MKII from their sites.
I guess that this line of Icom radios have now become TRUE ORPHAN Radios.
That will get the reputation as for Parts only Radios
73, Best Regards.

You have to remember the first version of this radio came out around 1995, that's 20 years ago. It is amazing that this radio has had such a long run of successful operation. But, many parts are no longer available as happens with things that are "long in the tooth"'

That may be long in the tooth for many things, but for hams it is practically new.  I bet many are still using the Kenwood and Yeasu  rigs with the tubes in the finals.  I have a Yeasu 757 I use sometimes but keep it as a backup.  Also have the mk2G and the 746pro that I bought new a few years after they came out.  I don't plan on replacing the 746 for a long time.  Are there any beter newer rigs made now that are in the same price range ?  There may be some just as good, but probably not any that would be much beter at the same price.  Doesn't Yeasu still make the 757d that is just about as old ?

You have to remember the first version of this radio came out around 1995, that's 20 years ago.  It is amazing that this radio has had such a long run of successful operation.  But, many parts are no longer available as happens with things that are "long in the tooth"'

The problem is not that the radio is so outdated that it is no longer usable, but the support is not there for repairs. As you may have read in the past emails, repair centers and individual repair techs are no longer accepting these radios for repair. The simple answer is that some components are unobtainable and no longer in stock.

I have my second IC-706MkIIG on the bench next to my Kenwood. I sold my first one years ago when I found out it was not repairable if it failed. The person who bought it didn't care about repair problems. I like the present radio a lot and plan to keep it until it too becomes unrepairable. Then I'll probably sell it for parts.

I just used Matt to fix my IC-706MKllG. He repaired it using no parts so maybe that is his criteria for deciding to repair them or not. Got it back, today and he did a great job getting me back on the air. Give him a call at 269-429-2334 and ask him if that is the situation regarding repairing or not.

I have a 706 which operates on VHF but not HF and a 706 MkII that has low deviation on FM. I had corresponded with several repair guys a year or so ago about the 706 but got the MkII and never sent it in. I just confirmed that Scot Malcom at MTS is still working on 706-series radios.

Good morning dear friends
I have a older Compaq Laptop that is surplus to me now. It works GREAT. It already has N1MM+ on it and set up for a ICOM 706 MKIIG.
Already set up for Rig Control too, but you will have to build your own cable for CW control. I'm keeping mine. Already has VE7CC cluster
software on it.
Has an Intel 1.40 Ghz processor, 1 GB of Ram, working wireless adapter, regular network port, of course USB and a regular SERIAL port.
Running Windows XP 2002 Service pack 3. Comes with the power supply and that's all. NO case or other accessories.
$50 and its yours all set up for your 706. I'll even pay shipping in CONUS only, overseas, Hawaii Alaska and Canada, and across
the ocean requires you to pay actual shipping fees.
Money Order only.
Thanks
Ronnie W5SUM

He can effect repairs on ALL models in the entire 706 line, not just the IC-706MKIIG (which is still supported by ICOM, but not the two earlier models)?

# 21586. Cannot Turn off on Rig

Yahoo group: ic706 (2010 — 2015)
Date: 2015-12-17 12:30:19 UTC
From: rugby29au@...
Topic: 21586  Message: 21586

Hi. A friend of mine cannot turn off his 706 MKII with the power switch on the rig. Switch appears to be working physically - ie nice spring back when released. When turned off at power supply and then turned back on the rig comes on where it last was. Works fine otherwise.
Keith VK4KH

Keith: Sometimes my ic-706 mk 2g gets confused. I push and hold the power button to turn off the rig, it turns off but comes back on. With the rig on I press the power button quickly once, The radio will now tun off normally with a "long" push of the power button. It may take several tries to get the rig back into sync. Good luck, Paul, KJ4AMH.

"Switch appears to be working physically - ie nice spring back when released. When turned off at power supply and then turned back on the rig comes on where it last was. Works fine otherwise."

I haven't pulled one of these open yet, but I "repaired" hundreds of mobile data terminals for a company I worked for in the 90's.

Depending on the design of the switch, it could be a metallic dome under the key, or a carbonized paint. The domes can crack and shift, yet still "bounce back" when a key is pressed. When this happens, the failure to work properly, yet appearing to, is close to 100%.

More common is an elastomeric switch. This can be some sort of rubber-like composite material or silicone switch body under the key. These are common in "soft" switches, modern computer keyboards, most telephones, radios, et cetera. In this case, the contact is a carbonized rubber/paint. These have a life-cycle, which can be hundreds of thousands of presses. They do fail. The extent of that is the conductive carbonized material wearing thin, or off. Everything still "feels" OK, but the sensing circuitry in the radio doesn't sense the right resistance and doesn't know a key has been pressed.

I have HEARD of people using conductive paint or glue and re-coating the back of the switch. Be careful that there is no excess material when painting. I have not seen or done it myself.

I HAVE seen and done- using a paper hole punch, cut a small circle (for adequately sized switches) and putting an aluminum disk on the back of the switch to replace the carbonized material entirely.

I have not seen these disks fail in over a decade, but there is a chance of metallic debris in the switch area after a lot of use.

The easiest, if you do your own work is buy a replacement switch from Icom.

If they don't have one, pull one from something else. Electronic refuse is available for free by the truckload, just look around or ask around. TVs, VCRs, DVD players, computers, laptops, you name it, LOTS of switches.... Find a similar switch in good condition and swap parts or switches.

Aside from that... There is mention of various Icom repair shops on this list.

Kurt
